INFORMATION SYSTEMS ENGINEERING E2.11

MATHEMATICS

Date Thursday 3rd June 2004 2.00 - 4.00 pm

Answer FOUR questions, to include at least one from Section B

Answers to Section A questions must be written in a different answer book from answers to Section B questions.

[Before starting, please make sure that the paper is complete. There should be SIX pages, with a total of SIX questions. Ask the invigilator for a replacement if this copy is faulty.]

Section A

1. If the Fourier transform of $f(t)$, $-\infty < t < \infty$, is given by

$$\hat{f}(\omega) = \int_{-\infty}^{\infty} f(t)e^{-i\omega t} dt ,$$

show that the Fourier transform of $f(-t)$ is $\hat{f}(-\omega)$ and that of $tf(t)$ is $i \frac{d}{d\omega} \hat{f}(\omega)$.

If for a positive constant a

$$g(t) = \begin{cases} e^{-at} & , \quad t \geq 0 , \\ 0 & , \quad t < 0 , \end{cases}$$

$$h(t) = e^{-a|t|} , \quad -\infty < t < \infty ,$$

and

$$k(t) = |t|e^{-a|t|} , \quad -\infty < t < \infty ,$$

find $\hat{g}(\omega)$.

Hence, or otherwise, show that

$$\hat{h}(\omega) = \frac{2a}{a^2 + \omega^2} \quad \text{and} \quad \hat{k}(\omega) = \frac{2(a^2 - \omega^2)}{(a^2 + \omega^2)^2} .$$

Find the Fourier Transform of the function $\frac{2a}{a^2 + t^2}$.

PLEASE TURN OVER

2. (i) The Laplace transform $\bar{y}(p)$ of a function $y(t)$ is

$$\bar{y}(p) = \int_0^{\infty} e^{-pt} y(t) dt .$$

Show that, assuming $y(t)$ behaves suitably at infinity, the Laplace transforms of

$$y'(t) \equiv \frac{dy}{dt} \quad \text{and} \quad y''(t) \equiv \frac{d^2y}{dt^2}$$

are given respectively by

$$\mathcal{L}\{y'\} = p\bar{y}(p) - y(0)$$

and

$$\mathcal{L}\{y''\} = p^2\bar{y}(p) - y'(0) - py(0) .$$

Hence solve the differential equation

$$\frac{d^2y}{dt^2} - 3\frac{dy}{dt} + 2y = g(t)$$

for an arbitrary function $g(t)$, for $t > 0$, given $y(0) = y'(0) = 0$.

- (ii) Evaluate $\int_C (P dx + Q dy)$ anti-clockwise around the boundary of the region R defined by

$$x^2 + y^2 \leq a^2, \quad x \geq 0, \quad y \geq 0,$$

taking

$$P = \frac{x^2}{x+y} \quad \text{and} \quad Q = -\frac{y^2}{x+y} .$$

3. (i) Sketch the region of the xy -plane over which the integral

$$\int_0^1 dx \int_{x^2}^1 4x e^{y^2} dy$$

is taken. Change the order of integration and hence evaluate the integral.

- (ii) Sketch the region of the xy -plane over which the integral

$$\int_0^1 dx \int_x^{\sqrt{2x-x^2}} \frac{y}{x^2 + y^2} dy$$

is taken.

Use polar co-ordinates to show that the value of the integral is $\frac{1}{2}$.

4. Find all the poles of $\frac{1}{z^6 + 1}$ and the residue at each pole.

For $R > 1$ let C_2 be the upper semi-circular arc of $|z| = R$,

directed from $+R$ to $-R$ and let C_1 be the diameter from $-R$ to R .

If C is the semi-circular path $C_1 + C_2$, calculate

$$\int_C \frac{dz}{z^6 + 1}.$$

By a careful discussion of the limit as $R \rightarrow \infty$ show that

$$\int_{-\infty}^{\infty} \frac{dx}{x^6 + 1} = \frac{2\pi}{3}.$$

5. A batch of IC chips contains 0.5% defectives. Each IC chip is subjected to a test, which gives a positive result if it identifies a chip as defective. The test correctly identifies a chip as defective with probability 0.99. The test misidentifies as defective 2 in every 100 chips. Let D denote the event that an IC chip is defective and T the event that the test identifies a chip as defective.

- (i) What is the probability that the test is positive when applied to a randomly-selected chip?
- (ii) Given that a randomly-chosen IC chip is declared defective by the tester, compute the probability that it is actually defective.

Lifetimes (in million of hours) of IC chips are approximately normally distributed with mean μ and variance σ^2 . A mainframe manufacturer requires that an IC chip should have a lifetime greater than 4 million hours. He takes a sample of size $n = 100$, with lifetimes denoted by

(x_1, \dots, x_{100}) , and observes $\sum_{i=1}^{100} x_i = 500$, $\sum_{i=1}^{100} x_i^2 = 2508.9$.

- (iii) Write down expressions for the unbiased estimators for μ and σ^2 , and compute the corresponding estimates given the data.
- (iv) Using a large-sample approximation, obtain a 95% confidence interval for μ .
- (v) Using the unbiased estimates of μ and σ^2 , evaluate the probability that the lifetime of a randomly selected IC chip is greater than 4 million hours.

(Approximate your results to 2 decimal points).

PLEASE TURN OVER

6. The random variable X has an Poisson distribution with probability mass function

$$P(X = x) = \frac{e^{-\lambda} \lambda^x}{x!}, \quad x = 0, 1, 2, \dots$$

where $\lambda > 0$.

- (i) Show that $E(X) = \lambda$.

In a manufacturing plant the number of accidents that occurs in a six-month period is a Poisson random variable with mean 2. Assuming that the rate of accidents in any six-month period is constant,

- (ii) what is the expected number of accidents per year?
(iii) what is the probability that there will be no accident in a given month?

Suppose we have a random sample, X_1, \dots, X_N , of size N from a Poisson distribution with mean $\mu > 0$.

- (iv) Show (and verify) that the maximum likelihood estimator for μ is

$$\hat{\mu} = \frac{\sum_{i=1}^N X_i}{N} = \bar{X}.$$

- (v) Suppose that the following data are observed

4, 2, 3, 3, 2, 2, 2, 0, 3, 2.

Find an estimate of μ .

- (vi) Express the expectation of the mean of the random sample

$$\bar{X} = \frac{\sum_{i=1}^N X_i}{N}$$

in terms of μ , and write down the formula for the variance of \bar{X} .

You may assume that the variance of a Poisson random variable is equal to its mean μ .

END OF PAPER

MATHEMATICAL FORMULAE

1. VECTOR ALGEBRA

$$\mathbf{a} = a_1\mathbf{i} + a_2\mathbf{j} + a_3\mathbf{k} = (a_1, a_2, a_3)$$

Scalar (dot) product: $\mathbf{a} \cdot \mathbf{b} = a_1b_1 + a_2b_2 + a_3b_3$

Vector (cross) product:

$$\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix}$$

Scalar triple product:

$$[\mathbf{a}, \mathbf{b}, \mathbf{c}] = \mathbf{a} \cdot \mathbf{b} \times \mathbf{c} = \mathbf{b} \cdot \mathbf{c} \times \mathbf{a} = \mathbf{c} \cdot \mathbf{a} \times \mathbf{b} = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

Vector triple product: $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{c} \cdot \mathbf{a})\mathbf{b} - (\mathbf{b} \cdot \mathbf{a})\mathbf{c}$

2. SERIES

$$(1+x)^\alpha = 1 + \alpha x + \frac{\alpha(\alpha-1)}{2!}x^2 + \frac{\alpha(\alpha-1)(\alpha-2)}{3!}x^3 + \dots \quad (\alpha \text{ arbitrary, } |x| < 1)$$

$$e^x = 1 + x + \frac{x^2}{2!} + \dots + \frac{x^n}{n!} + \dots,$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots + (-1)^n \frac{x^{2n}}{(2n)!} + \dots,$$

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \dots,$$

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots + (-1)^n \frac{x^{n+1}}{(n+1)} + \dots \quad (-1 < x \leq 1)$$

3. TRIGONOMETRIC IDENTITIES AND HYPERBOLIC FUNCTIONS

$$\sin(a+b) = \sin a \cos b + \cos a \sin b;$$

$$\cos(a+b) = \cos a \cos b - \sin a \sin b.$$

$$\cos iz = \cosh z; \quad \cosh iz = \cos z; \quad \sin iz = i \sinh z; \quad \sinh iz = i \sin z.$$

4. DIFFERENTIAL CALCULUS

(a) Leibniz's formula:

$$D^n(fg) = f D^n g + \binom{n}{1} Df D^{n-1} g + \dots + \binom{n}{r} D^r f D^{n-r} g + \dots + D^n f g.$$

(b) Taylor's expansion of $f(x)$ about $x = a$:

$$f(a+h) = f(a) + hf'(a) + \frac{h^2}{2!}f''(a) + \dots + \frac{h^n}{n!}f^{(n)}(a) + \epsilon_n(h),$$

$$\text{where } \epsilon_n(h) = h^{n+1}f^{(n+1)}(a + \theta h)/(n+1)!, \quad 0 < \theta < 1.$$

(c) Taylor's expansion of $f(x, y)$ about (a, b) :

$$f(a+h, b+k) = f(a, b) + [hf_x + kf_y]_{a,b} + 1/2! [h^2f_{xx} + 2hkf_{xy} + k^2f_{yy}]_{a,b} + \dots$$

(d) Partial differentiation of $f(x, y)$:

$$\text{i. If } y = y(x), \text{ then } f = F(x), \text{ and } \frac{dF}{dx} = \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} \frac{dy}{dx}.$$

$$\text{ii. If } x = x(t), y = y(t), \text{ then } f = F(t), \text{ and } \frac{dF}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}.$$

$$\text{iii. If } x = x(u, v), y = y(u, v), \text{ then } f = F(u, v), \text{ and}$$

$$\frac{\partial F}{\partial u} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial u}, \quad \frac{\partial F}{\partial v} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial v}.$$

(e) Stationary points of $f(x, y)$ occur where $f_x = 0, f_y = 0$ simultaneously.

Let (a, b) be a stationary point: examine $D = [f_{xx}f_{yy} - (f_{xy})^2]_{a,b}$.

If $D > 0$ and $f_{xx}(a, b) < 0$, then (a, b) is a maximum;

If $D > 0$ and $f_{xx}(a, b) > 0$, then (a, b) is a minimum;

If $D < 0$ then (a, b) is a saddle-point.

(f) Differential equations:

i. The first order linear equation $dy/dx + P(x)y = Q(x)$ has an integrating

$$\text{factor } I(x) = \exp\left[\int P(x)(dx)\right], \text{ so that } \frac{d}{dx}(Iy) = IQ.$$

ii. $P(x, y)dx + Q(x, y)dy = 0$ is exact if $\partial Q/\partial x = \partial P/\partial y$.

5. INTEGRAL CALCULUS

- (a) An important substitution: $\tan(\theta/2) = t$:
 $\sin \theta = 2t/(1+t^2)$, $\cos \theta = (1-t^2)/(1+t^2)$, $d\theta = 2dt/(1+t^2)$.

- (b) Some indefinite integrals:

$$\int (a^2 - x^2)^{-1/2} dx = \sin^{-1} \left(\frac{x}{a} \right), \quad |x| < a.$$

$$\int (a^2 + x^2)^{-1/2} dx = \sinh^{-1} \left(\frac{x}{a} \right) = \ln \left\{ \frac{x}{a} + \left(1 + \frac{x^2}{a^2} \right)^{1/2} \right\}.$$

$$\int (x^2 - a^2)^{-1/2} dx = \cosh^{-1} \left(\frac{x}{a} \right) = \ln \left| \frac{x}{a} + \left(\frac{x^2}{a^2} - 1 \right)^{1/2} \right|.$$

$$\int (a^2 + x^2)^{-1} dx = \left(\frac{1}{a} \right) \tan^{-1} \left(\frac{x}{a} \right).$$

6. NUMERICAL METHODS

- (a) Approximate solution of an algebraic equation:

If a root of $f(x) = 0$ occurs near $x = a$, take $x_0 = a$ and
 $x_{n+1} = x_n - [f(x_n)/f'(x_n)]$, $n = 0, 1, 2 \dots$

(Newton Raphson method).

- (b) Formulae for numerical integration: Write $x_n = x_0 + nh$, $y_n = y(x_n)$.

- i. Trapezium rule (1-strip): $\int_{x_0}^{x_1} y(x) dx \approx (h/2) [y_0 + y_1]$.
- ii. Simpson's rule (2-strip): $\int_{x_0}^{x_2} y(x) dx \approx (h/3) [y_0 + 4y_1 + y_2]$.

- (c) Richardson's extrapolation method: Let $I = \int_a^b f(x) dx$ and let I_1, I_2 be two estimates of I obtained by using Simpson's rule with intervals h and $h/2$.

Then, provided h is small enough,

$$I_2 + (I_2 - I_1)/15,$$

is a better estimate of I .

7. LAPLACE TRANSFORMS

Function	Transform	Function	Transform
$f(t)$	$F(s) = \int_0^\infty e^{-st} f(t) dt$	$af(t) + bg(t)$	$aF(s) + bG(s)$
df/dt	$sF(s) - f(0)$	d^2f/dt^2	$s^2F(s) - sf(0) - f'(0)$
$e^{at}f(t)$	$F(s-a)$	$tf(t)$	$-dF(s)/ds$
$(\partial/\partial\alpha)f(t, \alpha)$	$(\partial/\partial\alpha)F(s, \alpha)$	$\int_0^t f(t) dt$	$F(s)/s$
$\int_0^t f(u)g(t-u)du$	$F(s)G(s)$		
1	$1/s$	$t^n (n=1, 2, \dots)$	$n!/s^{n+1}, (s > 0)$
e^{at}	$1/(s-a), (s > a)$	$\sin \omega t$	$\omega/(s^2 + \omega^2), (s > 0)$
$\cos \omega t$	$s/(s^2 + \omega^2), (s > 0)$	$H(t-T) = \begin{cases} 0, & t < T \\ 1, & t > T \end{cases}$	$e^{-sT}/s, (s, T > 0)$

8. FOURIER SERIES

If $f(x)$ is periodic of period $2L$, then $f(x+2L) = f(x)$, and

$$f(x) = \frac{1}{2}a_0 + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{L} + \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{L}, \text{ where}$$

$$a_n = \frac{1}{L} \int_{-L}^L f(x) \cos \frac{n\pi x}{L} dx, \quad n = 0, 1, 2, \dots, \text{ and}$$

$$b_n = \frac{1}{L} \int_{-L}^L f(x) \sin \frac{n\pi x}{L} dx, \quad n = 1, 2, 3, \dots$$

Parseval's theorem

$$\frac{1}{L} \int_{-L}^L [f(x)]^2 dx = \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2).$$

1. For the **sample space**, Ω , the impossible event \emptyset , and events A, B, C :

$$P(\Omega) = 1, \quad P(\emptyset) = 0, \quad P(\bar{A}) = 1 - P(A).$$

$$P(A \cup B) = P(A) + P(B) - P(A \cap B).$$

$$P(A \cup B \cup C) = P(A) + P(B) + P(C) - P(A \cap B) - P(B \cap C) - P(A \cap C) + P(A \cap B \cap C).$$

Conditional probability: $P(A|B) = \frac{P(A \cap B)}{P(B)}$ provided that $P(B) > 0$.

The **odds** in favour of A is the ratio $P(A)/P(\bar{A})$.

Multiplication rule: $P(A \cap B) = P(A|B)P(B)$.

Chain rule: $P(A \cap B \cap C) = P(A)P(B|A)P(C|A \cap B)$.

Bayes' rule: $P(A|B) = \frac{P(A)P(B|A)}{P(A)P(B|A) + P(\bar{A})P(B|\bar{A})}$

Independence: Events A and B are **independent** if $P(B|A) = P(B)$.

Events A, B, C are **independent** if $P(A \cap B \cap C) = P(A)P(B)P(C)$,

$$P(A \cap B) = P(A)P(B), \quad P(B \cap C) = P(B)P(C), \quad P(C \cap A) = P(C)P(A).$$

2. A discrete random variable X has the **probability mass function** $\{p_x\} = \{P(X = x)\}$

The **expectation:** $E(X) = \mu = \sum_x x p_x$.

From random sample x_1, \dots, x_n , the **sample mean** $\bar{x} = (1/n) \sum_k x_k$ estimates $E(X)$.

The **variance:** $\text{var}(X) = \sigma^2 = E\{(X - \mu)^2\} = E(X^2) - \{E(X)\}^2$, where $E(X^2) = \sum_x x^2 p_x$.

The **sample variance:** $s^2 = \frac{1}{n-1} \left\{ \sum_k x_k^2 - \frac{1}{n} \left(\sum_j x_j \right)^2 \right\}$ estimates $\text{var}(X)$.

The **standard deviation:** $\text{sd}(X) = \sigma = \sqrt{\text{var}(X)}$.

For grouped data: if the value y is observed with frequency n_y , then

$$n = \sum_y n_y, \quad \sum_k x_k = \sum_y y n_y, \quad \sum_k x_k^2 = \sum_y y^2 n_y.$$

Estimated **skewness** is $\frac{1}{n-1} \sum_k \left(\frac{x_k - \bar{x}}{s} \right)^3$, estimated **kurtosis** is $\frac{1}{n-1} \sum_k \left(\frac{x_k - \bar{x}}{s} \right)^4$

3. **Binomial distribution:** X is *Binomial*(n, θ).

$$p_x = \binom{n}{x} \theta^x (1 - \theta)^{n-x} \quad (x = 0, 1, 2, \dots, n); \quad \mu = n\theta, \quad \sigma^2 = n\theta(1 - \theta).$$

Poisson distribution: X is *Poisson*(λ).

$$p_x = \frac{\lambda^x e^{-\lambda}}{x!} \quad (x = 0, 1, 2, \dots) \quad (\text{with } \lambda > 0); \quad \mu = \lambda, \quad \sigma^2 = \lambda.$$

Geometric distribution: X is *Geometric*(θ).

$$p_x = (1 - \theta)^{x-1} \theta \quad (x = 1, 2, 3, \dots); \quad \mu = \frac{1}{\theta}, \quad \sigma^2 = \frac{1 - \theta}{\theta^2}.$$

4. For **continuous** random variables, the **cumulative distribution function** (cdf)

$$F(x) = P(X \leq x) = \int_{x_0=-\infty}^x f(x_0) dx_0$$

The **probability density function** (pdf) $f(x) = \frac{dF(x)}{dx}$

$$E(X) = \int_{-\infty}^{\infty} x f(x) dx, \quad E(X^2) = \int_{-\infty}^{\infty} x^2 f(x) dx, \quad \text{var}(X) = E(X^2) - \{E(X)\}^2.$$

5. **Uniform distribution:** X is *Uniform*(α, β).

$$f(x) = \begin{cases} 1/(\beta - \alpha) & (\alpha < x < \beta), \\ 0 & (\text{otherwise}). \end{cases} \quad \begin{aligned} \mu &= (\alpha + \beta)/2, \\ \sigma^2 &= (\beta - \alpha)^2/12. \end{aligned}$$

Exponential distribution: X is *Exponential*(λ).

$$f(x) = \begin{cases} \lambda e^{-\lambda x} & (0 < x < \infty), \\ 0 & (-\infty < x \leq 0). \end{cases} \quad \begin{aligned} \mu &= 1/\lambda, \\ \sigma^2 &= 1/\lambda^2. \end{aligned}$$

Gamma distribution: X is *Gamma*(ν, λ).

$$f(x) = \begin{cases} \{1/\Gamma(\nu)\} \lambda^\nu x^{\nu-1} e^{-\lambda x} & (0 < x < \infty), \\ 0 & (-\infty < x \leq 0). \end{cases} \quad \begin{aligned} \mu &= \nu/\lambda, \\ \sigma^2 &= \nu/\lambda^2. \end{aligned}$$

Normal distribution: X is $N(\mu, \sigma^2)$.

$$f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp \left\{ -\frac{1}{2} \left(\frac{x - \mu}{\sigma} \right)^2 \right\} \quad (-\infty < x < \infty); \quad E(X) = \mu, \quad \text{var}(X) = \sigma^2$$

Standard normal distribution: Y is $N(0, 1)$.

If X is $N(\mu, \sigma^2)$, then $Y = \frac{X - \mu}{\sigma}$ is $N(0, 1)$.

For Y we write $\phi(y)$ for the pdf $f(y)$ and $\Phi(y)$ for the cdf $F(y)$

6. The lifetime T of a device in continuous operation with pdf $f(t)$ ($t > 0$):

The **reliability** at time t : $R(t) = P(T > t)$.

The **failure rate** or **hazard rate**: $h(t) = f(t)/R(t)$.

The **hazard function**: $H(t) = \int_0^t h(t_0) dt_0 = -\ln\{R(t)\}$

The **Weibull distribution** *Weibull*(α, β) has $H(t) = \beta t^\alpha$.

For a system of k devices, which operate independently:

The **system reliability**, R , is the probability of a path of operating devices.

Let $R_i = P(D_i) = P(\text{"device } i \text{ operates"})$.

A system of devices in **series** fails if any device fails.

$$R = P(D_1 \cap D_2 \cap \cdots \cap D_k) = R_1 R_2 \cdots R_k.$$

A system of devices in **parallel** operates if any device operates.

$$R = P(D_1 \cup D_2 \cup \cdots \cup D_k) = 1 - (1 - R_1)(1 - R_2) \cdots (1 - R_k).$$

7. The **covariance** of X and Y :

$$\text{cov}(X, Y) = E\{(X - E(X))(Y - E(Y))\} = E(XY) - E(X)E(Y)$$

The estimate of $\text{cov}(X, Y)$ from n pairs of observations $(x_1, y_1), \dots, (x_n, y_n)$ is

$$s_{xy} = \frac{1}{n-1} S_{xy} \quad \text{where} \quad S_{xy} = \sum_k x_k y_k - \frac{1}{n} (\sum_i x_i) (\sum_j y_j)$$

The **correlation coefficient**: $\rho = \text{corr}(X, Y) = \frac{\text{cov}(X, Y)}{\text{sd}(X) \cdot \text{sd}(Y)}$

The **sample correlation coefficient**: $r = \frac{S_{xy}}{\sqrt{S_{xx}S_{yy}}}$ estimates ρ ,

where $S_{xx} = (n-1)s_{xx}$, $S_{yy} = (n-1)s_{yy}$, and s_{xx} and s_{yy} are s^2 calculated from the x s and y s respectively.

If X and Y have the joint pdf $f(x, y)$:

the **marginal pdf** for X is $f_X(x) = \int_{-\infty}^{\infty} f(x, y_0) dy_0$

the **conditional pdf** for X given $Y = y$ is $f_{X|Y}(x|y) = \frac{f(x, y)}{f_Y(y)}$ provided $f_Y(y) > 0$

The pdf for $Z = X + Y$ is $f_Z(z) = \int_{x=-\infty}^{\infty} f_X(x) f_{Y|X}(z-x|x) dx$

$$E(X+Y) = E(X) + E(Y), \quad \text{var}(X+Y) = \text{var}(X) + \text{var}(Y) + 2\text{cov}(X, Y)$$

If X is $N(\mu_1, \sigma_1^2)$, Y is $N(\mu_2, \sigma_2^2)$, and $\text{cov}(X, Y) = c$, then $X+Y$ is $N(\mu_1 + \mu_2, \sigma_1^2 + \sigma_2^2 + 2c)$

8. **Chi-squared distribution** χ_k^2 : $E(Z) = k$, $\text{var}(Z) = 2k$

If Y_1, \dots, Y_k are independent $N(0, 1)$ then $Z = Y_1^2 + \dots + Y_k^2$ is χ_k^2 .

For a random sample from $N(\mu, \sigma^2)$, $(n-1)s^2/\sigma^2$ is from χ_{n-1}^2 , and

$\sqrt{n}(\bar{x} - \mu)/s$ is from t_{n-1} , the **Student t distribution** on $n-1$ degrees of freedom

9. If t estimates θ , the **standard error** of t , $\text{se}(t)$, is $\text{sd}(T)$, the standard deviation of the **sampling distribution** of t , and **bias** $(t) = E(T - \theta)$.

The **mean square error**: $E\{(T - \theta)^2\} = \text{var}(T) + \{\text{bias}(t)\}^2$.

If \bar{x} estimates μ , then $\text{bias}(\bar{x}) = 0$, $\text{se}(\bar{x}) = \sigma/\sqrt{n}$, $\widehat{\text{se}}(\bar{x}) = s/\sqrt{n}$, and $\text{MSE} = \sigma^2/n$.

The **likelihood** is the joint probability as a function of the unknown parameter θ .

$$\ell(\theta; x_1, x_2, \dots, x_n) = P(X_1 = x_1) \cdots P(X_n = x_n) \quad (\text{discrete distribution})$$

$$\ell(\theta; x_1, x_2, \dots, x_n) = f(x_1)f(x_2) \cdots f(x_n) \quad (\text{continuous distribution})$$

The **maximum likelihood estimator** (MLE) is $\hat{\theta}$ for which the likelihood is a maximum.

10. If t estimates θ , a 95% **confidence interval** for θ is an estimated interval that contains 95% of the sampling distribution of θ .

If x_1, x_2, \dots, x_n are a random sample from $N(\mu, \sigma^2)$ and σ^2 is known, then the 95% CI for μ is $(\bar{x} - 1.96\sigma/\sqrt{n}, \bar{x} + 1.96\sigma/\sqrt{n})$.

If σ^2 is estimated, then from the table of t_{n-1} we find $t_0 = t_{n-1, 0.05}$. Then the 95% CI for μ is $(\bar{x} - t_0 s/\sqrt{n}, \bar{x} + t_0 s/\sqrt{n})$.

A **significance test** of H_0 rejects H_0 if, assuming that H_0 is true, a test statistic is in a rejection region of its sampling distribution.

The **chi-squared goodness-of-fit test** checks how well a fitted distribution fits the data:

The frequencies n_y are grouped so that the fitted frequency \hat{n}_y for every group exceeds about 5.

$X^2 = \sum (n_y - \hat{n}_y)^2 / \hat{n}_y$ is referred to the table of χ_k^2 with significance point p , where k is the number of terms summed, less one for each constraint, *eg* matching total frequency, and matching \bar{x} with μ .

11. To fit the **linear regression** model $y = \alpha + \beta x$ by $\hat{y} = \hat{\alpha} + \hat{\beta}x$ from observations $(x_1, y_1), \dots, (x_n, y_n)$, the least squares fit is $\hat{\alpha} = \bar{y} - \bar{x}\hat{\beta}$, $\hat{\beta} = S_{xy}/S_{xx}$.

The **residual sum of squares**, $RSS = S_{yy} - \frac{S_{xy}^2}{S_{xx}}$

$$\hat{\sigma}^2 = \frac{RSS}{n-2} \text{ estimates } \sigma^2; \quad \frac{n-2}{\sigma^2} \hat{\sigma}^2 \text{ is } \chi_{n-2}^2$$

The predictor $\hat{y}_x = \hat{\alpha} + \hat{\beta}x$ of y when $X = x$ is $\widehat{\text{var}(\hat{y}_x)} = \left\{ \frac{1}{n} + \frac{(x - \bar{x})^2}{S_{xx}} \right\} \hat{\sigma}^2$

$$\frac{\hat{\alpha} - \alpha}{\widehat{\text{se}}(\hat{\alpha})}, \quad \frac{\hat{\beta} - \beta}{\widehat{\text{se}}(\hat{\beta})}, \quad \frac{\hat{y}_x - \alpha - \beta x}{\widehat{\text{se}}(\hat{y}_x)} \text{ are each } t_{n-2}.$$

A future single observation y' at $X = x$ has prediction error $\hat{y}_x - y'$ which has variance $\text{var}(\hat{y}_x) + \sigma^2$

The 95% **prediction interval** for y' at $X = x$ is $\hat{y}_x \pm t_{n-2, 0.05} \sqrt{\widehat{\text{var}(\hat{y}_x)} + \hat{\sigma}^2}$

THE STANDARD NORMAL DISTRIBUTION FUNCTION

Entries in table are probabilities p such that $\Phi(z)=p$

EXAMINATION QUESTION / SOLUTION

2003 - 2004

ISE 200

QUESTION

Please write on this side only, legibly and neatly, between the margins

SOLUTION

Given $\int_{-\infty}^{\infty} f(t) e^{-i\omega t} dt = \hat{f}(\omega)$ Then F.T. of $f(-t)$ is

$$\int_{-\infty}^{\infty} f(-t) e^{-i\omega t} dt \xrightarrow{t=-s} = \int_{+\infty}^{-\infty} f(s) e^{i\omega s} (-ds) \\ = \int_{-\infty}^{\infty} f(s) e^{i\omega s} ds = \hat{f}(-\omega)$$

(2)

Differentiate ① w.r.t ω

$$\int_{-\infty}^{\infty} f(t) \frac{\partial}{\partial \omega} (e^{-i\omega t}) dt = \frac{d \hat{f}}{d \omega} = \int_{-\infty}^{\infty} -it f(t) e^{-i\omega t} dt$$

F.T. of $t f(t)$ is $i \frac{d \hat{f}(\omega)}{d \omega}$

(5)

$$\hat{g}(\omega) = \int_0^{\infty} e^{-at} e^{-i\omega t} dt = \frac{e^{-(a+i\omega)t}}{-(a+i\omega)} = \frac{1}{a+i\omega} \quad \text{Since } a > 0$$

(3)

$h(t) = g(t) + g(-t)$ so

$$\hat{h}(\omega) = \hat{g}(\omega) + \hat{g}(-\omega) = \frac{1}{a+i\omega} + \frac{1}{a-i\omega} = \frac{2a}{a^2 + \omega^2}$$

(4)

$t g(t)$ has F.T. $i \frac{d}{d \omega} \left(\frac{1}{a+i\omega} \right) = \frac{-i^2}{(a+i\omega)^2} = \frac{1}{(a+i\omega)^2}$

$h(t) = t g(t) + (-t g(-t))$ has F.T.

$$\frac{1}{(a+i\omega)^2} - \frac{1}{(a-i\omega)^2} = \frac{2(a^2 - \omega^2)}{(a^2 + \omega^2)^2}$$

(3)

Then use symmetry formula

$\hat{f}(t)$ has F.T. $2\pi f(-\omega)$

So F.T. of $\frac{2a}{a^2 + t^2}$ is $2\pi h(-\omega) = 2\pi e^{-a|\omega|}$

(3)

Please write on this side only, legibly and neatly, between the margins

$$\begin{aligned} \text{F.T. of } \frac{dy}{dt} &\sim \int_0^{\infty} e^{-pt} \frac{dy}{dt} dt \\ &= \left[e^{-pt} y \right]_0^{\infty} + \int_0^{\infty} p e^{-pt} y dt \\ &= -y(0) + p \bar{y}(p) \end{aligned} \quad (2)$$

$$\begin{aligned} \text{Similarly F.T. of } \frac{d^2y}{dt^2} &\sim \int_0^{\infty} e^{-pt} \frac{d^2y}{dt^2} dt \\ &= \left[e^{-pt} \frac{dy}{dt} \right]_0^{\infty} + \int_0^{\infty} p e^{-pt} \frac{dy}{dt} dt \\ &= -y'(0) + p \int_0^{\infty} e^{-pt} \frac{dy}{dt} dt \\ &= -y'(0) - p(y(0)) + p^2 \bar{y}(p) \end{aligned} \quad (2)$$

Consider $\frac{d^2y}{dt^2} - 3\frac{dy}{dt} + 2y = g(t)$ and take L.T.

$$p^2 \bar{y}(p) - y'(0) - p y(0) - 3(p \bar{y}(p) - y(0)) + 2 \bar{y}(p) = \bar{g} \quad (2)$$

$$\text{i.e. } p^2 \bar{y} - 3p \bar{y} + 2 \bar{y} = \bar{g}$$

$$\text{So } \bar{y} = \frac{\bar{g}}{p^2 - 3p + 2} = \frac{\bar{g}}{(p-1)(p-2)} = \left(\frac{1}{p-2} - \frac{1}{p-1} \right) \bar{g} \quad (2)$$

$$\begin{aligned} \therefore y(t) &= \int_0^t [e^{2(t-u)} - e^{(t-u)}] g(u) du \\ &= e^{2t} \int_0^t e^{-2u} g(u) du - e^t \int_0^t e^{-u} g(u) du. \end{aligned} \quad (2)$$

$$I = \int_C P dx + Q dy$$

On C_1 $x = t, y = 0$ $I = \int_C P dx + Q dy = \int_{t=0}^a \left(P \frac{dx}{dt} + Q \frac{dy}{dt} \right) dt$

$$= \int_0^a b \cdot 1 dt = a^2/2$$

(2)

On C_3 $I = - \int_{C_3} P dx + Q dy$ $x = 0, y = t$

$$= - \int_{t=0}^a \left(P \frac{dx}{dt} + Q \frac{dy}{dt} \right) dt = - \int_0^a -b \cdot 1 dt = a^2/2$$

(2)

On C_2 let $x = a \cos \theta, y = a \sin \theta$

(1)

$$I_2 = \int_{\theta=0}^{\theta=\pi/2} \left(P \frac{dx}{d\theta} + Q \frac{dy}{d\theta} \right) d\theta$$

$$= \int_0^{\pi/2} \frac{a^2 \cos^2 \theta (-a \sin \theta) - a^2 \sin^2 \theta (a \cos \theta)}{a \cos \theta + a \sin \theta} d\theta$$

$$= \int_0^{\pi/2} -a^2 \sin \theta \cos \theta d\theta = \left[-\frac{a^2}{2} \sin^2 \theta \right]_0^{\pi/2} = -\frac{a^2}{2}$$

(3)

$$\therefore I = I_1 + I_2 + I_3 = a^2/2$$

Poles where $z^6 = -1 = e^{i\pi} \therefore z = e^{i(\pi/6 + n\pi/3)} = e^{i\theta}$

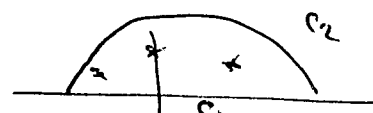

where $\theta = \pm \frac{\pi}{6}, \pm \frac{\pi}{2}, \pm \frac{5\pi}{6}$.

If we take z as one of these values (so $z^6 = -1$) then the residue of $\frac{1}{z^6+1}$ at η is $\frac{1}{\frac{d}{dz}(z^6+1)} = \frac{1}{6z^5} = -\frac{z}{6}$

So residues

$e^{i\pi/6}$	$-\frac{1}{6} \left(\frac{\sqrt{3}}{2} + i/2 \right)$
$e^{i\pi/2}$	$-i/6$
$e^{5\pi i/6}$	$-\frac{1}{6} \left(-\frac{\sqrt{3}}{2} + i/2 \right)$
$e^{-i\pi/6}$	$\frac{1}{6} \left(\frac{\sqrt{3}}{2} + i/2 \right)$
$-e^{i\pi/2}$	$i/6$
$-e^{5\pi i/6}$	$\frac{1}{6} \left(-\frac{\sqrt{3}}{2} + i/2 \right)$

$$\int_{C_1+C_2} \frac{dz}{z^6+1} = 2\pi i \left(\text{Res at } e^{-i\pi/6} + \text{Res at } i + \text{Res at } e^{2\pi i/3} \right)$$

$$= 2\pi i \left[-\frac{\sqrt{3}}{2} - \frac{i}{2} - i + \frac{\sqrt{3}}{2} - i/2 \right] / 6 = \frac{2\pi}{3}$$

by residue thm

$$\int_{C_1} \frac{dz}{z^6+1} = \int_{-R}^R \frac{dx}{x^6+1} \quad \text{On } C_2 \quad |z^6+1| \geq R^6-1 \text{ so}$$

$$\left| \int_{C_2} \frac{dz}{z^6+1} \right| \leq \frac{\pi R}{R^6-1} \rightarrow 0 \text{ as } R \rightarrow \infty$$

\therefore For any $R > 1$ $\frac{2\pi i}{3} = \int_{C_1} + \int_{C_2}$ and as $R \rightarrow \infty$

$$\int_{-\infty}^{\infty} \frac{dx}{x^6+1} = \frac{2\pi i}{3}$$

4

Problem 1

(a)

$$P(D) = \frac{0.5}{100} = 0.005$$

$$P(\bar{D}) = 1 - P(D) = 0.995$$

$$P(T|D) = 0.99$$

$$P(T|\bar{D}) = \frac{2}{100} = 0.02$$

Apply Law of Total Probabilities

$$P(T) = P(T|D)P(D) + P(T|\bar{D})P(\bar{D})$$

$$= (0.99 \times 0.005) + (0.02 \times 0.995)$$

$$= 0.00495 + 0.0199 = 0.02485$$
