For Internal Students of Imperial College

This paper is also taken for the relevant examination for the Associateship of the City & Guilds of London Institute

PART II : MATHEMATICS 4 (ELECTRICAL ENGINEERING)

Wednesday 31st May 2006      2.00 - 4.00 pm

*Answer FOUR questions.*

*Please answer questions from Section A and Section B in separate answerbooks.*

*A statistics data sheet is provided.*

Corrected Copy

*[Before starting, please make sure that the paper is complete; there should be 5 pages, with a total of 6 questions. Ask the invigilator for a replacement if your copy is faulty.]*

## SECTION A

1. Consider a real  $n \times n$  symmetric matrix  $A$  with distinct eigenvalues  $\lambda_i$  and corresponding normalized eigenvectors  $e_i$  for  $i = 1, \dots, n$ .

(a) Show that all the  $\lambda_i$  are real.

(b) Show that the eigenvectors  $e_i$  obey the orthogonality relation

$$e_i^T e_j = \begin{cases} 1, & i = j, \\ 0, & i \neq j. \end{cases}$$

(c) Show that the  $n \times n$  matrix  $P = \{e_1 e_2 \dots e_n\}$  satisfies the relation

$$P^T P = I,$$

where  $I$  is the  $n \times n$  unit matrix.

2. Show that the quadratic form

$$Q = 4x_1^2 - 4x_1x_2 + x_2^2 + 6x_3^2$$

can be written as

$$Q = x^T A x,$$

where  $x = (x_1, x_2, x_3)^T$  and  $A$  is a real symmetric matrix, which is to be found.

Hence show that  $Q$  can be re-expressed in the diagonal form

$$Q = \lambda_1 y_1^2 + \lambda_2 y_2^2 + \lambda_3 y_3^2,$$

where the  $\lambda_i$  are to be determined, by finding a matrix  $P$  that satisfies  $x = Py$  where  $y = (y_1, y_2, y_3)^T$ .

Find  $y_1$ ,  $y_2$  and  $y_3$  in terms of  $x_1$ ,  $x_2$  and  $x_3$  from the matrix  $P$ .

PLEASE TURN OVER

SECTION B

3. (i) The discrete random variable  $X_1$  takes values 0, 1 and 2 with probabilities  $1/2$ ,  $1/3$  and  $1/6$ , respectively. A second random variable  $X_2$  takes values 1 and 3 with probabilities  $1/4$  and  $3/4$ , respectively, and is independent of  $X_1$ . Compute the probabilities:

(a)  $P(X_1 + X_2 = 3)$

(b)  $P(3X_1/X_2 < 2)$

- (ii) The probability that a job running on a CPU (Central Processor Unit) will fail has been estimated to be  $q = 0.05$ . Assume there is a cluster with  $n = 10$  of these CPUs all working independently. What is the probability that:

(a) no jobs fail?

(b) exactly one job fails?

(c) at least one job fails?

- (iii) The breakdowns of a piece of electrical equipment occur in a Poisson process of rate  $\lambda = 0.1$  per year. Find the probability of:

(a) one breakdown in 5 years;

(b) no more than 2 breakdowns in one year.

4. (i) Let the positive random variable  $T$  represent the lifetime of an electrical component.

(a) Carefully define the hazard function  $h(t)$  of the component.

Now suppose that the distribution of the lifetime is exponential, so that the probability density function is  $f(t) = \lambda e^{-\lambda t}$ ,  $t \geq 0$ .

- (b) Show that, for  $s, t \geq 0$ ,  $T$  is memoryless, that is

$$P(T > s + t \mid T > t) = P(T > s).$$

(c) Calculate the hazard function in this case, and interpret the answer.

- (ii) Let the independent positive random variables  $T_A$  and  $T_B$  represent the lifetime of electrical components A and B, respectively.

(a) If  $f_{T_A}(t)$  and  $f_{T_B}(t)$  are the probability density functions for  $T_A$  and  $T_B$ , respectively, what is the joint probability density function  $f_{T_A, T_B}(t_A, t_B)$  for  $T_A, T_B$ ?

- (b) Show that the probability that A fails before B is given by

$$\int_0^\infty F_{T_A}(t) f_{T_B}(t) dt.$$

- (c) Assuming that  $T_A$  and  $T_B$  both have exponential failure time distributions, i.e.

$$f_{T_A}(t) = \begin{cases} \lambda_A e^{-\lambda_A t} & \text{if } t \geq 0, \\ 0 & \text{otherwise,} \end{cases} \quad \text{and} \quad f_{T_B}(t) = \begin{cases} \lambda_B e^{-\lambda_B t} & \text{if } t \geq 0 \\ 0 & \text{otherwise,} \end{cases}$$

with  $\lambda_A, \lambda_B > 0$ , find the odds ratio

$$P\{A \text{ fails before } B\} / P\{B \text{ fails before } A\}.$$

5. (i) A certain process for producing an industrial chemical yields a product containing two types of impurities. For a specified sample from this process, let  $Y_1$  denote the proportion of impurities in the sample and  $Y_2$  the proportion of type I impurity among all impurities found. Suppose that the joint distribution of  $Y_1$  and  $Y_2$  can be modelled by the following probability density function:

$$f_{Y_1, Y_2}(y_1, y_2) = \begin{cases} 2(1 - y_1) & 0 \leq y_1 \leq 1, 0 \leq y_2 \leq 1, \\ 0 & \text{otherwise} \end{cases}$$

Find the expected value of the proportion of type I impurities in the sample.

- (ii) Two brands of CPU processors, denoted A and B, are each guaranteed for one year. In a random sample of 50 CPUs of brand A, 12 were observed to fail before the guarantee period ended. A random sample of 60 brand B CPUs also revealed 12 failures during the guarantee period. Estimate the 98% confidence interval for the true difference between proportions of failures during the guarantee period.

6. (i) Let  $X_1, \dots, X_n$  be iid random variables from a Poisson distribution with unknown parameter  $\lambda$ . Assume  $n \geq 2$ .

(a) Show that  $\Lambda_1 = \frac{1}{n} \sum_{i=1}^n X_i$  and  $\Lambda_2 = \frac{1}{2}(X_1 + X_2)$  are both unbiased estimators of  $\lambda$ .

(b) Which estimator is more efficient? Justify your answer.

- (ii) An MA(3) process is defined as

$$y_t = e_t + \frac{1}{2}e_{t-1} + \frac{1}{4}e_{t-2},$$

where  $\{e_t\}$  is the white noise with  $E(e_t) = 0$  and  $\text{var}(e_t) = \sigma_e^2$ .

(a) Evaluate the expected value  $E(y_t)$  and variance  $\text{var}(y_t)$ .

(b) Evaluate the covariance  $\text{cov}(y_t, y_{t-s})$  for  $s \geq 1$ .

(c) Is the process  $\{y_t\}$  stationary? Justify your answer.

END OF PAPER

MATHEMATICAL FORMULAE

1. VECTOR ALGEBRA

$$\mathbf{a} = a_1\mathbf{i} + a_2\mathbf{j} + a_3\mathbf{k} = (a_1, a_2, a_3)$$

Scalar (dot) product:  $\mathbf{a} \cdot \mathbf{b} = a_1b_1 + a_2b_2 + a_3b_3$

Vector (cross) product:  $\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix}$

Scalar triple product:  $[\mathbf{a}, \mathbf{b}, \mathbf{c}] = \mathbf{a} \cdot \mathbf{b} \times \mathbf{c} = \mathbf{b} \cdot \mathbf{c} \times \mathbf{a} = \mathbf{c} \cdot \mathbf{a} \times \mathbf{b} = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$

Vector triple product:  $\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{c} \cdot \mathbf{a})\mathbf{b} - (\mathbf{b} \cdot \mathbf{a})\mathbf{c}$

2. SERIES

$$(1+x)^\alpha = 1 + \alpha x + \frac{\alpha(\alpha-1)}{2!}x^2 + \frac{\alpha(\alpha-1)(\alpha-2)}{3!}x^3 + \dots \quad (\alpha \text{ arbitrary, } |x| < 1)$$

$$e^x = 1 + x + \frac{x^2}{2!} + \dots + \frac{x^n}{n!} + \dots$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots + (-1)^n \frac{x^{2n}}{(2n)!} + \dots$$

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \dots$$

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots + (-1)^n \frac{x^{n+1}}{(n+1)!} + \dots \quad (-1 < x \leq 1)$$

3. TRIGONOMETRIC IDENTITIES AND HYPERBOLIC FUNCTIONS

$$\sin(a+b) = \sin a \cos b + \cos a \sin b;$$

$$\cos(a+b) = \cos a \cos b - \sin a \sin b.$$

$$\cos iz = \cosh z; \quad \cosh iz = \cos z; \quad \sin iz = i \sinh z; \quad \sinh iz = i \sin z.$$

4. DIFFERENTIAL CALCULUS

(a) Leibniz's formula:

$$D^n(fg) = f D^n g + \binom{n}{1} Df D^{n-1} g + \dots + \binom{n}{r} D^r f D^{n-r} g + \dots + D^n f g.$$

(b) Taylor's expansion of  $f(x)$  about  $x = a$ :

$$f(a+h) = f(a) + hf'(a) + \frac{h^2}{2!}f''(a) + \dots + \frac{h^n}{n!}f^{(n)}(a) + \epsilon_n(h),$$

$$\text{where } \epsilon_n(h) = h^{n+1}f^{(n+1)}(a + \theta h)/(n+1)!, \quad 0 < \theta < 1.$$

(c) Taylor's expansion of  $f(x, y)$  about  $(a, b)$ :

$$f(a+h, b+k) = f(a, b) + [hf_x + kf_y]_{a,b} + \frac{1}{2!} [h^2 f_{xx} + 2hkf_{xy} + k^2 f_{yy}]_{a,b} + \dots$$

(d) Partial differentiation of  $f(x, y)$ :

i. If  $y = y(x)$ , then  $f = F(x)$ , and  $\frac{dF}{dx} = \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} \frac{dy}{dx}$ .

ii. If  $x = x(t)$ ,  $y = y(t)$ , then  $f = F(t)$ , and  $\frac{dF}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}$ .

iii. If  $x = x(u, v)$ ,  $y = y(u, v)$ , then  $f = F(u, v)$ , and

$$\frac{\partial F}{\partial u} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial u}, \quad \frac{\partial F}{\partial v} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial v}.$$

(e) Stationary points of  $f(x, y)$  occur where  $f_x = 0$ ,  $f_y = 0$  simultaneously.

Let  $(a, b)$  be a stationary point: examine  $D = [f_{xx}f_{yy} - (f_{xy})^2]_{a,b}$ .

If  $D > 0$  and  $f_{xx}(a, b) < 0$ , then  $(a, b)$  is a maximum;

If  $D > 0$  and  $f_{xx}(a, b) > 0$ , then  $(a, b)$  is a minimum;

If  $D < 0$  then  $(a, b)$  is a saddle-point.

(f) Differential equations:

i. The first order linear equation  $dy/dx + P(x)y = Q(x)$  has an integrating factor  $I(x) = \exp[\int P(x)(dx)]$ , so that  $\frac{d}{dx}(Iy) = IQ$ .

ii.  $P(x, y)dx + Q(x, y)dy = 0$  is exact if  $\partial Q/\partial x = \partial P/\partial y$ .

## 5. INTEGRAL CALCULUS

(a) An important substitution:  $\tan(\theta/2) = t$ :  
 $\sin \theta = 2t/(1+t^2)$ ,  $\cos \theta = (1-t^2)/(1+t^2)$ ,  $d\theta = 2dt/(1+t^2)$ .

(b) Some indefinite integrals:

$$\int (a^2 - x^2)^{-1/2} dx = \sin^{-1} \left( \frac{x}{a} \right), \quad |x| < a.$$

$$\int (a^2 + x^2)^{-1/2} dx = \sinh^{-1} \left( \frac{x}{a} \right) = \ln \left\{ \frac{x}{a} + \left( 1 + \frac{x^2}{a^2} \right)^{1/2} \right\}.$$

$$\int (x^2 - a^2)^{-1/2} dx = \cosh^{-1} \left( \frac{x}{a} \right) = \ln \left| \frac{x}{a} + \left( \frac{x^2}{a^2} - 1 \right)^{1/2} \right|.$$

$$\int (a^2 + x^2)^{-1} dx = \left( \frac{1}{a} \right) \tan^{-1} \left( \frac{x}{a} \right).$$

## 6. NUMERICAL METHODS

(a) Approximate solution of an algebraic equation:

If a root of  $f(x) = 0$  occurs near  $x = a$ , take  $x_0 = a$  and  
 $x_{n+1} = x_n - [f(x_n)/f'(x_n)]$ ,  $n = 0, 1, 2 \dots$

(Newton Raphson method).

(b) Formulae for numerical integration: Write  $x_n = x_0 + nh$ ,  $y_n = y(x_n)$ .

i. Trapezium rule (1-strip):  $\int_{x_0}^{x_1} y(x) dx \approx (h/2) [y_0 + y_1]$ .

ii. Simpson's rule (2-strip):  $\int_{x_0}^{x_2} y(x) dx \approx (h/3) [y_0 + 4y_1 + y_2]$ .

(c) Richardson's extrapolation method: Let  $I = \int_a^b f(x) dx$  and let  $I_1, I_2$  be two estimates of  $I$  obtained by using Simpson's rule with intervals  $h$  and  $h/2$ .

Then, provided  $h$  is small enough,

$$I_2 + (I_2 - I_1)/15,$$

is a better estimate of  $I$ .

## 7. LAPLACE TRANSFORMS

Function	Transform	Function	Transform
$f(t)$	$F(s) = \int_0^\infty e^{-st} f(t) dt$	$af(t) + bg(t)$	$aF(s) + bG(s)$
$df/dt$	$sF(s) - f(0)$	$d^2 f/dt^2$	$s^2 F(s) - sf(0) - f'(0)$
$e^{at} f(t)$	$F(s-a)$	$tf(t)$	$-dF(s)/ds$
$(\partial/\partial \alpha) f(t, \alpha)$	$(\partial/\partial \alpha) F(s, \alpha)$	$\int_0^t f(t) dt$	$F(s)/s$
$\int_0^t f(u) g(t-u) du$	$F(s)G(s)$		
1	$1/s$	$t^n (n = 1, 2, \dots)$	$n!/s^{n+1}, (s > 0)$
$e^{at}$	$1/(s-a), (s > a)$	$\sin \omega t$	$\omega/(s^2 + \omega^2), (s > 0)$
$\cos \omega t$	$s/(s^2 + \omega^2), (s > 0)$	$H(t-T) = \begin{cases} 0, & t < T \\ 1, & t > T \end{cases}$	$e^{-sT}/s, (s, T > 0)$

## 8. FOURIER SERIES

If  $f(x)$  is periodic of period  $2L$ , then  $f(x+2L) = f(x)$ , and

$$f(x) = \frac{1}{2} a_0 + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{L} + \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{L}, \text{ where}$$

$$a_n = \frac{1}{L} \int_{-L}^L f(x) \cos \frac{n\pi x}{L} dx, \quad n = 0, 1, 2, \dots, \text{ and}$$

$$b_n = \frac{1}{L} \int_{-L}^L f(x) \sin \frac{n\pi x}{L} dx, \quad n = 1, 2, 3, \dots$$

Parseval's theorem

$$\frac{1}{L} \int_{-L}^L [f(x)]^2 dx = \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2).$$

## 1. Probabilities for events

For events  $A$ ,  $B$ , and  $C$ 

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

More generally  $P(\cup A_i) = \sum P(A_i) - \sum P(A_i \cap A_j) + \sum P(A_i \cap A_j \cap A_k) - \dots$

The odds in favour of  $A$ 

$$P(A) / P(\bar{A})$$

Conditional probability

$$P(A|B) = \frac{P(A \cap B)}{P(B)} \quad \text{provided that } P(B) > 0$$

Chain rule

$$P(A \cap B \cap C) = P(A) P(B|A) P(C|A \cap B)$$

Bayes' rule

$$P(A|B) = \frac{P(A) P(B|A)}{P(A) P(B|A) + P(\bar{A}) P(B|\bar{A})}$$

 $A$  and  $B$  are independent if

$$P(B|A) = P(B)$$

 $A$ ,  $B$ , and  $C$  are independent if

$$P(A \cap B \cap C) = P(A) P(B) P(C), \quad \text{and}$$

$$P(A \cap B) = P(A) P(B), \quad P(B \cap C) = P(B) P(C), \quad P(C \cap A) = P(C) P(A)$$

## 2. Probability distribution, expectation and variance

The probability distribution for a discrete random variable  $X$  is the complete set of

$$\text{probabilities } \{p_x\} = \{P(X = x)\}$$

Expectation  $E(X) = \mu = \sum_x x p_x$

Sample mean  $\bar{x} = \frac{1}{n} \sum_k x_k$  estimates  $\mu$  from random sample  $x_1, x_2, \dots, x_n$

Variance  $\text{var}(X) = \sigma^2 = E\{(X - \mu)^2\} = E(X^2) - \mu^2$ , where  $E(X^2) = \sum_x x^2 p_x$

Sample variance  $s^2 = \frac{1}{n-1} \left\{ \sum_k x_k^2 - \frac{1}{n} \left( \sum_j x_j \right)^2 \right\}$  estimates  $\sigma^2$

Standard deviation  $\text{sd}(X) = \sigma$

If value  $y$  is observed with frequency  $n_y$ 

$$n = \sum_y n_y, \quad \sum_k x_k = \sum_y y n_y, \quad \sum_k x_k^2 = \sum_y y^2 n_y$$

For function  $g(x)$  of  $x$ ,  $E\{g(X)\} = \sum_x g(x) p_x$

Skewness  $\beta_1 = E\left(\frac{X - \mu}{\sigma}\right)^3$  is estimated by  $\frac{1}{n-1} \sum \left(\frac{x_i - \bar{x}}{s}\right)^3$

Kurtosis  $\beta_2 = E\left(\frac{X - \mu}{\sigma}\right)^4 - 3$  is estimated by  $\frac{1}{n-1} \sum \left(\frac{x_i - \bar{x}}{s}\right)^4 - 3$

Sample median  $\tilde{x}$ . If the sample values  $x_1, \dots, x_n$  are ordered  $x_{(1)} \leq x_{(2)} \leq \dots \leq x_{(n)}$   
 $\tilde{x} = x_{(\frac{n+1}{2})}$  if  $n$  is odd, and  $\tilde{x} = \frac{1}{2}(x_{(\frac{n}{2})} + x_{(\frac{n+2}{2})})$  if  $n$  is even.

$\alpha$ -quantile  $Q(\alpha)$  is such that  $P(X \leq Q(\alpha)) = \alpha$

Sample  $\alpha$ -quantile  $\hat{Q}(\alpha)$  is the sample value for which the proportion of values  $\leq \hat{Q}(\alpha)$  is  $\alpha$  (using linear interpolation between values on either side)

The sample median  $\tilde{x}$  estimates the population median  $Q(0.5)$ .

### 3. Probability distribution for a continuous random variable

The cumulative distribution function (cdf)  $F(x) = P(X \leq x) = \int_{x_0=-\infty}^x f(x_0)dx_0$

The probability density function (pdf)  $f(x) = \frac{dF(x)}{dx}$

$$E(X) = \mu = \int_{-\infty}^{\infty} x f(x)dx, \quad \text{var}(X) = \sigma^2 = E(X^2) - \mu^2,$$

$$\text{where } E(X^2) = \int_{-\infty}^{\infty} x^2 f(x)dx$$

### 4. Discrete probability distributions

Discrete Uniform *Uniform* ( $n$ )

$$p_x = \frac{1}{n} \quad (x = 1, 2, \dots, n)$$

$$\mu = \frac{1}{2}(n+1), \quad \sigma^2 = \frac{1}{12}(n^2-1)$$

Binomial distribution *Binomial* ( $n, \theta$ )

$$p_x = \binom{n}{x} \theta^x (1-\theta)^{n-x} \quad (x = 0, 1, 2, \dots, n) \quad \mu = n\theta, \quad \sigma^2 = n\theta(1-\theta)$$

Poisson distribution *Poisson* ( $\lambda$ )

$$p_x = \frac{\lambda^x e^{-\lambda}}{x!} \quad (x = 0, 1, 2, \dots) \quad (\text{with } \lambda > 0) \quad \mu = \lambda, \quad \sigma^2 = \lambda$$

Geometric distribution *Geometric* ( $\theta$ )

$$p_x = (1-\theta)^{x-1} \theta \quad (x = 1, 2, 3, \dots) \quad \mu = \frac{1}{\theta}, \quad \sigma^2 = \frac{1-\theta}{\theta^2}$$

### 5. Continuous probability distributions

Uniform distribution *Uniform* ( $\alpha, \beta$ )

$$f(x) = \begin{cases} \frac{1}{\beta - \alpha} & (\alpha < x < \beta), \\ 0 & (\text{otherwise}). \end{cases} \quad \begin{aligned} \mu &= (\alpha + \beta)/2, \\ \sigma^2 &= (\beta - \alpha)^2/12. \end{aligned}$$

Exponential distribution  $Exponential(\lambda)$

$$f(x) = \begin{cases} \lambda e^{-\lambda x} & (0 < x < \infty), \\ 0 & (-\infty < x \leq 0). \end{cases} \quad \begin{matrix} \mu = 1/\lambda, \\ \sigma^2 = 1/\lambda^2. \end{matrix}$$

Normal distribution  $N(\mu, \sigma^2)$

$$f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left\{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2\right\} \quad (-\infty < x < \infty)$$
$$E(X) = \mu, \quad \text{var}(X) = \sigma^2$$

Standard normal distribution  $N(0, 1)$

If  $X$  is  $N(\mu, \sigma^2)$ , then  $Y = \frac{X - \mu}{\sigma}$  is  $N(0, 1)$

## 6. Reliability

For a device in continuous operation with failure time random variable  $T$  having pdf  $f(t)$  ( $t > 0$ )

The reliability function at time  $t$   $R(t) = P(T > t)$

The failure rate or hazard function  $h(t) = f(t)/R(t)$

The cumulative hazard  $H(t) = \int_0^t h(t_0) dt_0 = -\ln\{R(t)\}$

The Weibull( $\alpha, \beta$ ) distribution has  $H(t) = \beta t^\alpha$

## 7. System reliability

For a system of  $k$  devices, which operate independently, let

$$R_i = P(D_i) = P(\text{"device } i \text{ operates"})$$

The system reliability,  $R$ , is the probability of a path of operating devices

A system of devices in series operates only if every device operates

$$R = P(D_1 \cap D_2 \cap \dots \cap D_k) = R_1 R_2 \dots R_k$$

A system of devices in parallel operates if any device operates

$$R = P(D_1 \cup D_2 \cup \dots \cup D_k) = 1 - (1 - R_1)(1 - R_2) \dots (1 - R_k)$$

## 8. Covariance and correlation

The covariance of  $X$  and  $Y$   $\text{cov}(X, Y) = E(XY) - \{E(X)\}\{E(Y)\}$

From pairs of observations  $(x_1, y_1), \dots, (x_n, y_n)$   $S_{xy} = \sum_k x_k y_k - \frac{1}{n} (\sum_i x_i) (\sum_j y_j)$

$$S_{xx} = \sum_k x_k^2 - \frac{1}{n} (\sum_i x_i)^2, \quad S_{yy} = \sum_k y_k^2 - \frac{1}{n} (\sum_j y_j)^2$$

Sample covariance  $s_{xy} = \frac{1}{n-1} S_{xy}$  estimates  $\text{cov}(X, Y)$

Correlation coefficient  $\rho = \text{corr}(X, Y) = \frac{\text{cov}(X, Y)}{\text{sd}(X) \cdot \text{sd}(Y)}$

Sample correlation coefficient  $r = \frac{S_{xy}}{\sqrt{S_{xx} S_{yy}}}$  estimates  $\rho$

## 9. Sums of random variables

$$E(X + Y) = E(X) + E(Y)$$

$$\text{var}(X + Y) = \text{var}(X) + \text{var}(Y) + 2 \text{cov}(X, Y)$$

$$\text{cov}(aX + bY, cX + dY) = (ac) \text{var}(X) + (bd) \text{var}(Y) + (ad + bc) \text{cov}(X, Y)$$

If  $X$  is  $N(\mu_1, \sigma_1^2)$ ,  $Y$  is  $N(\mu_2, \sigma_2^2)$ , and  $\text{cov}(X, Y) = c$ ,

then  $X + Y$  is  $N(\mu_1 + \mu_2, \sigma_1^2 + \sigma_2^2 + 2c)$

## 10. Bias, standard error, mean square error

If  $t$  estimates  $\theta$  (with random variable  $T$  giving  $t$ )

Bias of  $t$   $\text{bias}(t) = E(T) - \theta$

Standard error of  $t$   $\text{se}(t) = \text{sd}(T)$

Mean square error of  $t$   $\text{MSE}(t) = E\{(T - \theta)^2\} = \{\text{se}(t)\}^2 + \{\text{bias}(t)\}^2$

If  $\bar{x}$  estimates  $\mu$ , then  $\text{bias}(\bar{x}) = 0$ ,  $\text{se}(\bar{x}) = \sigma/\sqrt{n}$ ,  $\text{MSE}(\bar{x}) = \sigma^2/n$ ,  $\widehat{\text{se}}(\bar{x}) = s/\sqrt{n}$

Central limit property if  $n$  is fairly large,  $\bar{x}$  is from  $N(\mu, \sigma^2/n)$  approximately

## 11. Likelihood

The likelihood is the joint probability as a function of the unknown parameter  $\theta$ .

For a random sample  $x_1, x_2, \dots, x_n$

$$\ell(\theta; x_1, x_2, \dots, x_n) = P(X_1 = x_1 | \theta) \cdots P(X_n = x_n | \theta) \quad (\text{discrete distribution})$$

$$\ell(\theta; x_1, x_2, \dots, x_n) = f(x_1 | \theta) f(x_2 | \theta) \cdots f(x_n | \theta) \quad (\text{continuous distribution})$$

The maximum likelihood estimator (MLE) is  $\hat{\theta}$  for which the likelihood is a maximum.

12. Confidence intervals

If  $x_1, x_2, \dots, x_n$  are a random sample from  $N(\mu, \sigma^2)$  and  $\sigma^2$  is known, then the 95% confidence interval for  $\mu$  is  $(\bar{x} - 1.96 \frac{\sigma}{\sqrt{n}}, \bar{x} + 1.96 \frac{\sigma}{\sqrt{n}})$

If  $\sigma^2$  is estimated, then from the Student t table for  $t_{n-1}$  we find  $t_0 = t_{n-1, 0.05}$

The 95% confidence interval for  $\mu$  is  $(\bar{x} - t_0 \frac{s}{\sqrt{n}}, \bar{x} + t_0 \frac{s}{\sqrt{n}})$

13. Standard normal table

Values of pdf  $\phi(y) = f(y)$  and cdf  $\Phi(y) = F(y)$

$y$	$\phi(y)$	$\Phi(y)$	$y$	$\phi(y)$	$\Phi(y)$	$y$	$\phi(y)$	$\Phi(y)$	$y$	$\Phi(y)$
0	.399	.5	.9	.266	.816	1.8	.079	.964	2.8	.997

16. The chi-squared goodness-of-fit test

The frequencies  $n_y$  are grouped so that the fitted frequency  $\hat{n}_y$  for every group exceeds about 5.

$$X^2 = \sum_y \frac{(n_y - \hat{n}_y)^2}{\hat{n}_y} \text{ is referred to the table of } \chi_k^2 \text{ with significance point } p,$$

where  $k$  is the number of terms summed, less one for each constraint, eg matching total frequency, and matching  $\bar{x}$  with  $\mu$ .

17. Joint probability distributions

Discrete distribution  $\{p_{xy}\}$ , where  $p_{xy} = P(\{X = x\} \cap \{Y = y\})$ .

Let  $p_{x\bullet} = P(X = x)$ , and  $p_{\bullet y} = P(Y = y)$ , then

$$p_{x\bullet} = \sum_y p_{xy}, \text{ and } P(X = x | Y = y) = \frac{p_{xy}}{p_{\bullet y}}$$

Continuous distribution

Joint cdf  $F(x, y) = P(\{X \leq x\} \cap \{Y \leq y\}) = \int_{x_0=-\infty}^x \int_{y_0=-\infty}^y f(x_0, y_0) dx_0 dy_0$

Joint pdf  $f(x, y) = \frac{d^2 F(x, y)}{dx dy}$

Marginal pdf of X  $f_X(x) = \int_{-\infty}^{\infty} f(x, y_0) dy_0$

Conditional pdf of X given Y = y  $f_{X|Y}(x|y) = \frac{f(x, y)}{f_Y(y)}$  (provided  $f_Y(y) > 0$ )

18. Linear regression

To fit the linear regression model  $y = \alpha + \beta x$  by  $\hat{y}_x = \hat{\alpha} + \hat{\beta}x$  from observations  $(x_1, y_1), \dots, (x_n, y_n)$ , the least squares fit is

$$\hat{\alpha} = \bar{y} - \bar{x}\hat{\beta}, \quad \hat{\beta} = S_{xy}/S_{xx}$$

The residual sum of squares  $RSS = S_{yy} - \frac{S_{xy}^2}{S_{xx}}$

$$\hat{\sigma}^2 = \frac{RSS}{n-2}, \quad \frac{n-2}{\sigma^2} \hat{\sigma}^2 \text{ is from } \chi_{n-2}^2$$

$$E(\hat{\alpha}) = \alpha, \quad E(\hat{\beta}) = \beta,$$

$$\text{var}(\hat{\alpha}) = \frac{\sum x_i^2}{n S_{xx}} \sigma^2, \quad \text{var}(\hat{\beta}) = \frac{\sigma^2}{S_{xx}}, \quad \text{cov}(\hat{\alpha}, \hat{\beta}) = -\frac{\bar{x}}{S_{xx}} \sigma^2$$

$$\hat{y}_x = \hat{\alpha} + \hat{\beta}x, \quad E(\hat{y}_x) = \alpha + \beta x, \quad \text{var}(\hat{y}_x) = \left\{ \frac{1}{n} + \frac{(x - \bar{x})^2}{S_{xx}} \right\} \sigma^2$$

$$\frac{\hat{\alpha} - \alpha}{\widehat{\text{se}}(\hat{\alpha})}, \quad \frac{\hat{\beta} - \beta}{\widehat{\text{se}}(\hat{\beta})}, \quad \frac{\hat{y}_x - \alpha - \beta x}{\widehat{\text{se}}(\hat{y}_x)} \text{ are each from } t_{n-2}$$

19. Design matrix for factorial experiments With 3 factors each at 2 levels

$$\mathbf{X} = \begin{pmatrix} 1 & -1 & -1 & 1 & -1 & 1 & 1 & -1 \\ 1 & 1 & -1 & -1 & -1 & -1 & 1 & 1 \\ 1 & -1 & 1 & -1 & -1 & 1 & -1 & 1 \\ 1 & 1 & 1 & 1 & -1 & -1 & -1 & -1 \\ 1 & -1 & -1 & 1 & 1 & -1 & -1 & 1 \\ 1 & 1 & -1 & -1 & 1 & 1 & -1 & -1 \\ 1 & -1 & 1 & -1 & 1 & -1 & 1 & -1 \\ 1 & 1 & 1 & 1 & 1 & 1 & 1 & 1 \end{pmatrix}$$

## Solutions

Note: U means UNSEEN

3 (i) The required probabilities are

$$\begin{aligned} (a) \quad P(X_1 + X_2 = 3) &= P\{(X_1 = 0 \cap X_2 = 3) \cup (X_1 = 2 \cap X_2 = 1)\} \\ &= P(\{X_1 = 0 \cap X_2 = 3\}) + P(\{X_1 = 2 \cap X_2 = 1\}) \\ &= \frac{1}{2} \times \frac{3}{4} + \frac{1}{2} \times \frac{1}{4} = \frac{11}{24} \end{aligned}$$

2 U

$$\begin{aligned} (b) \quad P(3X_1/X_2 < 2) &= P\{(X_1 = 0) \cup (X_1 = 1 \cap X_2 = 3)\} \\ &= P(\{X_1 = 0\}) + P(\{X_1 = 1\})P(\{X_2 = 3\}) \\ &= \frac{1}{2} + \frac{1}{3} \times \frac{3}{4} = \frac{3}{4} \end{aligned}$$

2 U

(ii) Define the random variable  $X = \{\text{number of completed jobs}\}$  and notice that  $X$  follows a binomial distribution with success probability  $p = 1 - q = 0.95$ . The required probabilities are:

$$(a) \quad P(X = 10) = (0.95)^{10} = 0.598$$

3 U

$$(b) \quad P(X = 9) = 10(0.95)^9 0.05 = 0.315$$

3 U

$$(c) \quad 1 - P(X = 10) = 1 - 0.598 = 0.402$$

3 U

(iii) Define the random variable  $X = \{\text{number of breakdowns in 5 years}\}$  and notice that  $X$  follows a Poisson( $\lambda t$ ) distribution, where  $\lambda t = 0.5$ . The required probability is

$$(a) \quad P(X = 1) = e^{(-0.5)} 0.5 = 0.303$$

3 U

Now define the random variable  $Y = \{\text{number of breakdowns in 1 year}\}$  and notice that  $Y$  follows a Poisson( $\lambda t$ ) distribution, where  $\lambda t = 0.1$ . The required probability is

$$(b) \quad P(Y = 0) + P(Y = 1) + P(Y = 2) = e^{-0.1} + 0.1e^{-0.1} + \frac{0.1^2 e^{-0.1}}{2!} = 0.999$$

4 U

20

4. (i) (a) The hazard function is the conditional density that a  $t$ -unit-old system will fail in the imminent future given that has survived so far. It is defined as

$$h(t) = \frac{f(t)}{1 - F(t)}$$

2 U

(b) For an exponential distribution we have  $F(t) = 1 - e^{-\lambda t}$ ,  $t \geq 0$  so that  $1 - F(t) = e^{-\lambda t}$ . Hence with  $s, t > 0$ ,

$$P(T > s + t | T > t) = \frac{P(T > s + t)}{P(T > t)} = \frac{e^{-\lambda(s+t)}}{e^{-\lambda t}} = P(T > s)$$

3 U

(c) The hazard function in this case is

$$h(t) = \frac{f(t)}{1 - F(t)} = \frac{\lambda e^{-\lambda t}}{e^{-\lambda t}} = \lambda$$

This is sensible since components with exponential lifetime are memoryless, and hence the probability of failure in  $(t, t + \delta t)$  is independent of  $t$

3 U

(ii) (a) Since  $T_A$  and  $T_B$  are independent,  $f_{T_A, T_B}(t_A, t_B) = f_{T_A}(t_A)f_{T_B}(t_B)$

4 U

$$\begin{aligned} (b) \quad P(T_A < T_B) &= \int_0^\infty dt_B \int_0^{t_B} dt_A f_{T_A, T_B}(t_A, t_B) \\ &= \int_0^\infty dt_B \int_0^{t_B} dt_A f_{T_A}(t_A) f_{T_B}(t_B) \\ &= \int_0^\infty dt_B f_{T_B}(t_B) \int_0^{t_B} dt_A f_{T_A}(t_A) \\ &= \int_0^\infty dt_B f_{T_B}(t_B) F_{T_A}(t_B) \\ &= \int_0^\infty F_{T_A}(t) f_{T_B}(t) dt \end{aligned}$$

4 U

(c) From the assumptions made, we have that  $F_{T_A}(t) = 1 - e^{-\lambda_A t}$  and

$$P(T_A < T_B) = \int_0^\infty [1 - e^{-\lambda_A t}] \lambda_B e^{-\lambda_B t} dt = \int_0^\infty \lambda_B e^{-\lambda_B t} dt - \lambda_B \int_0^\infty e^{-(\lambda_A + \lambda_B)t} dt$$

but  $(\lambda_A + \lambda_B) \int_0^\infty e^{-(\lambda_A + \lambda_B)t} dt = 1$  because this is the integral of an exponential probability density function with parameter  $\lambda_A + \lambda_B > 0$ . Hence

$$P(T_A < T_B) = 1 - \frac{\lambda_B}{\lambda_A + \lambda_B} = \frac{\lambda_A}{\lambda_A + \lambda_B}$$

By using symmetry,

$$\frac{P(T_A < T_B)}{P(T_B < T_A)} = \frac{\lambda_A}{\lambda_A + \lambda_B} \times \frac{\lambda_A + \lambda_B}{\lambda_B} = \frac{\lambda_A}{\lambda_B}$$

This is the ratio of decay parameters.

4 U

20

5. (i) Since  $Y_1$  is the proportion of impurities in the sample and  $Y_2$  is the proportion of type I impurities among the sample impurities, it follows that  $Y_1 Y_2$  is the proportion of type I

impurities in the entire sample. Thus we want to find

$$\begin{aligned} E(Y_1 Y_2) &= \int_0^1 \int_0^1 2y_1 y_2 (1 - y_1) dy_2 dy_1 = 2 \int_0^1 y_1 (1 - y_1) \frac{1}{2} dy_1 \\ &= \int_0^1 (y_1 - y_1^2) dy_1 = \left[ \frac{y_1^2}{2} - \frac{y_1^3}{3} \right]_0^1 = \frac{1}{2} - \frac{1}{3} = \frac{1}{6} \end{aligned}$$

10 U

(ii) The confidence interval for the difference of two proportions is given by

$$(\hat{p}_1 - \hat{p}_2) \pm z_{\alpha/2} \sqrt{\frac{p_1(1-p_1)}{n_1} + \frac{p_2(1-p_2)}{n_2}}$$

In our case, we have  $p_1 = 0.24, p_2 = 0.20, n_1 = 50, n_2 = 60$  and  $z_{0.01} = 2.33$ . Substituting  $\hat{p}_1$  and  $\hat{p}_2$  for  $p_1$  and  $p_2$  in the computation of the standard deviation, we obtain

$$(0.24 - 0.20) \pm 2.33 \sqrt{\frac{(0.24)(0.76)}{50} + \frac{(0.20)(0.80)}{60}} = 0.04 \pm 0.185 = (-0.145, 0.225)$$

10 U

6. (i) (a) They are both unbiased estimators of  $\lambda$  because

$$E(\Lambda_1) = \frac{1}{n} \sum_i E(X_i) = \frac{1}{n} (n\lambda) = \lambda \quad \text{and} \quad E(\Lambda_2) = \frac{1}{2} \{E(X_1) + E(X_2)\} = \frac{1}{2} (2\lambda) = \lambda$$

3 U

(b) The corresponding variances are

$$\text{Var}(\Lambda_1) = \frac{1}{n^2} \sum_i \text{Var}(X_i) = \frac{1}{n^2} (n\lambda) = \frac{\lambda}{n}$$

and

$$\text{Var}(\Lambda_2) = \frac{1}{4} (2\lambda) = \frac{\lambda}{2}$$

Thus if  $n > 2$ ,  $\Lambda_1$  is a more efficient estimator of  $\lambda$  than  $\Lambda_2$  because  $\frac{\lambda}{n} < \frac{\lambda}{2}$

5 U

(ii) (a)

$$E(y_t) = 0 \quad \text{Var}(y_t) = \left(1 + \frac{1}{4} + \frac{1}{16}\right) \sigma_e^2 = \frac{21}{16} \sigma_e^2$$

3 U

$$\begin{aligned}
 (b) \quad \text{Cov}(y_t, y_{t-s}) &= \text{Cov} \left( e_t + \frac{1}{2}e_{t-1} + \frac{1}{4}e_{t-2}, e_{t-s} + \frac{1}{2}e_{t-s-1} + \frac{1}{4}e_{t-s-2} \right) \\
 &= \begin{cases} \left( \frac{1}{2} + \frac{1}{8} \right) \sigma_e^2 = \frac{5}{8} \sigma_e^2 & \text{for } s = 1 \\ \frac{1}{4} \sigma_e^2 & \text{for } s = 2 \\ 0 & \text{for } s > 2 \end{cases}
 \end{aligned}$$

6 U

(c) The process is stationary because mean <sup>variance</sup> and covariance are independent of  $t$
