[E2.8 (Maths 3) 2007]

B.ENG. AND M.ENG. EXAMINATIONS 2007

For Internal Students of Imperial College London

This paper is also taken for the relevant examination for the Associateship of the City & Guilds of London Institute

PART II : MATHEMATICS 3 (ELECTRICAL ENGINEERING)

Wednesday 30th May 2007 2.00 - 5.00 pm

Answer EIGHT questions.

Please answer questions from Section A and Section B in separate answerbooks.

Mathematical formulae and Statistics data sheets are provided.

[Before starting, please make sure that the paper is complete; there should be 8 pages, with a total of 12 questions. Ask the invigilator for a replacement if your copy is faulty.]

SECTION A

[E2.8 (Maths 3) 2007]

1. (i) Consider the mapping

$$w = \frac{1}{(z-1)^2}$$

from the z -plane to the w -plane where $z = x + iy$ and $w = u + iv$.

Show that the circle $(x-1)^2 + y^2 = R^2$ in the z -plane maps to the circle $u^2 + v^2 = R^{-4}$ in the w -plane.

- (ii) Consider the mapping $w = 1/z$.

For the class of circles

$$(x-1)^2 + (y-1)^2 = r^2,$$

show that when $r = \sqrt{2}$ the circle maps to the straight line

$$v = u - 1/2$$

in the w -plane, and that when $r = 1$, the circle maps to the circle

$$(u-1)^2 + (v+1)^2 = 1$$

in the w -plane.

2. Consider the complex function

$$F(z) = \frac{e^{iz}}{z^2 + 1}.$$

- (i) Find the two poles of $F(z)$.

- (ii) Find the residues of $F(z)$ at these two poles.

- (iii) By considering the semi-circular contour of radius R in the upper half-plane and taking the limit as $R \rightarrow \infty$, show that

$$\int_0^\infty \frac{\cos x}{1+x^2} dx = \frac{\pi}{2e}.$$

PLEASE TURN OVER

3. Consider a circular contour \mathcal{C} taken as the unit circle $z = e^{i\theta} \quad (0 \leq \theta \leq 2\pi)$.

Convert the integral

$$I = \int_0^{2\pi} \frac{d\theta}{3 + \cos \theta}$$

to the complex integral around \mathcal{C}

$$I = \frac{2}{i} \oint_{\mathcal{C}} \frac{dz}{z^2 + 6z + 1},$$

and hence use the Residue Theorem to show that

$$I = \pi / \sqrt{2}.$$

4. If $\bar{f}(\omega)$ is the Fourier transform of $f(t)$, prove Parseval's equality

$$\int_{-\infty}^{\infty} |f(t)|^2 dt = \frac{1}{2\pi} \int_{-\infty}^{\infty} |\bar{f}(\omega)|^2 d\omega.$$

The sinc-function $\text{sinc}(t)$ and the tent function $\Lambda(t)$ are defined respectively by

$$\text{sinc}(t) = \frac{\sin(\frac{1}{2}t)}{\frac{1}{2}t};$$

$$\Lambda(t) = \begin{cases} 1 + t, & -1 \leq t \leq 0, \\ 1 - t, & 0 \leq t \leq 1. \end{cases}$$

Show that

$$(i) \quad \bar{\Lambda}(\omega) = \text{sinc}^2(\omega);$$

$$(ii) \quad \int_{-\infty}^{\infty} \text{sinc}^4(\omega) d\omega = \frac{4\pi}{3}.$$

5. $\bar{f}(s) = \mathcal{L}\{f(t)\}$ and $\bar{g}(s) = \mathcal{L}\{g(t)\}$ are the Laplace transforms of two functions $f(t)$ and $g(t)$ respectively. The convolution of $f(t)$ with $g(t)$ is defined as

$$f * g = \int_0^t f(u) g(t-u) du .$$

- (i) Prove the Laplace convolution theorem

$$\mathcal{L}(f * g) = \bar{f}(s)\bar{g}(s)$$

by using double integration. Sketch the region of integration.

- (ii) Hence, or otherwise, show that

$$\mathcal{L}^{-1}\left\{\frac{s}{(s^2+1)^2}\right\} = \frac{1}{2}t \sin t .$$

You may assume that

$$\mathcal{L}\{\cos t\} = \frac{s}{s^2+1} \quad \text{and} \quad \mathcal{L}\{\sin t\} = \frac{1}{s^2+1} .$$

6. A second-order ordinary differential equation, with initial values, takes the form

$$\ddot{x} + 4\dot{x} + 5x = f(t) ,$$

where $f(t)$ is a driving force. At $t = 0$, $x(0) = x_0$ and $\dot{x}(0) = \dot{x}_0$.

- (i) When $x_0 = \dot{x}_0 = 0$, use the Laplace convolution theorem to show that the solution of the differential equation can be expressed as

$$x(t) = \int_0^t e^{-2u} \sin u f(t-u) du . \quad (*)$$

- (ii) When $x_0 = 1$ and $\dot{x}_0 = -2$, show that the solution is comprised of two parts, the first being the integral in (*) and the second being $e^{-2t} \cos t$.

PLEASE TURN OVER

7. Consider a two-dimensional region \mathcal{R} bounded by a closed piecewise-smooth curve \mathcal{C} . Using Green's Theorem in a plane, choose the components of a vector field $\mathbf{u}(x, y)$ in terms of $P(x, y)$ and $Q(x, y)$ to prove the two-dimensional form of the Divergence Theorem

$$\oint_{\mathcal{C}} \mathbf{u} \cdot \mathbf{n} \, ds = \iint_{\mathcal{R}} \operatorname{div} \mathbf{u} \, dx \, dy \quad (1)$$

where \mathbf{n} is a unit vector normal to \mathcal{C} .

Suppose

$\mathbf{u}(x, y)$ is given by

$$\mathbf{u}(x, y) = \frac{1}{2} x^2 g'(y) \mathbf{i} + x g(y) \mathbf{j}$$

where $g = g(y)$ is a function with the property $g(0) = 0$.

The region \mathcal{R} lies in the first quadrant and is bounded by the x -axis, the curve $y = x^2$ and the line $x = 1$.

(i) Sketch the region \mathcal{R} ;

(ii) Evaluate the double integral on the right hand side of (1) to show that

$$\oint_{\mathcal{C}} \mathbf{u} \cdot \mathbf{n} \, ds = \int_0^1 g(\theta) \, d\theta ,$$

where $\theta = x^2$.

Hint: Green's Theorem in a plane states that for any differentiable functions $P(x, y)$ and $Q(x, y)$

$$\oint_{\mathcal{C}} [P(x, y) \, dx + Q(x, y) \, dy] = \iint_{\mathcal{R}} \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) \, dx \, dy$$

where \mathcal{R} is a region in the plane and \mathcal{C} is the counter-clockwise closed curve surrounding \mathcal{R} .

8. (i) The integral

$$\int \int_{\mathcal{R}} \frac{xy}{x^2+y^2} dx dy$$

is to be evaluated over the region \mathcal{R} bounded by the curves $y = 0$, $y = x$, $x^2 - y^2 = 1$ and $xy = 1$.

Sketch the region \mathcal{R} . Find the values of the new variables $u = xy$ and $v = x^2 - y^2$ on each part of the boundary of \mathcal{R} and then evaluate the integral by first changing to the new variables.

- (ii) Find the position of the centre of mass of area S which is the sector of the circle $x^2 + y^2 = 1$ between the lines $x = 0$ and $y = x$ with $x \geq 0$.

Note, the centre of mass is defined by

$$\bar{x} = \frac{1}{A} \iint_S x dx dy, \quad \bar{y} = \frac{1}{A} \iint_S y dx dy$$

where $A = \iint_S dx dy$ is the area of the sector S .

9. A vector field $\mathbf{E}(x, y, z)$ is given by

$$\mathbf{E} = e^{ax} \cos by \mathbf{i} + e^{-x} \sin y \mathbf{j} + z \mathbf{k}.$$

Find $\text{curl } \mathbf{E}$ and find the values of a and b for which there exists a scalar field $\phi(x, y, z)$ such that $\mathbf{E} = \text{grad } \phi$. Find $\phi(x, y, z)$.

Calculate $\text{div } \mathbf{E}$ and show that for the values of a and b found above

$$\text{div } \mathbf{E} = 1.$$

Show also that if $\mathbf{F} = \text{curl } \mathbf{B} + \mathbf{E}$, then for these values of a and b and any differentiable vector field \mathbf{B} we also have

$$\text{div } \mathbf{F} = 1.$$

PLEASE TURN OVER

10. Green's theorem in the plane states that

$$\oint_{\mathcal{C}} (f dx + g dy) = \iint_{\mathcal{R}} \left(\frac{\partial g}{\partial x} - \frac{\partial f}{\partial y} \right) dx dy$$

where \mathcal{C} is the counter-clockwise boundary of \mathcal{R} .

(i) Use this theorem to write down a condition for the line integral

$$\int_{\mathcal{C}_1} (f dx + g dy)$$

to be independent of the path \mathcal{C}_1 joining the two fixed points A and B .

(ii) Hence show that the line integral

$$\int_{\mathcal{C}_1} [(2e^{2x} \sin y \cos y) dx + e^{2x}(\cos^2 y - \sin^2 y) dy]$$

is independent of the path \mathcal{C}_1 joining the points $(0, 0)$ and $(1, \pi/4)$ and evaluate it.

(iii) Consider the line integral

$$\oint_{\mathcal{C}} (f dx + g dy)$$

where

$$f = \frac{-y}{x^2 + y^2}, \quad g = \frac{x}{x^2 + y^2}$$

and \mathcal{C} is the counter-clockwise circle centre 0 and radius 1.

Show that

$$\frac{\partial g}{\partial x} = \frac{\partial f}{\partial y}$$

everywhere except at the point $(0, 0)$.

Show that $\oint_{\mathcal{C}} (f dx + g dy) = 2\pi$.

How do you reconcile this result with Green's theorem in the plane?

Hint: use polar coordinates $x = r \cos \theta$, $y = r \sin \theta$ to evaluate the line integral.

SECTION B

[E 2.8 (Maths 3) 2007]

11. Consider the discrete random variables X and Y with joint probability mass function $p(x, y) = P(X = x, Y = y)$ given by the table below.

		y		
		0	1	2
x	0	0.42	0.12	0.06
	1	0.30	0.04	0.06

- (i) Find the marginal distribution of X and the marginal distribution of Y .
- (ii) Find $E(X)$ and $E(Y)$.
- (iii) Find $P(X = 1 | Y > 0)$.
- (iv) Are X and Y correlated? Give your reasoning.
- (v) Are X and Y independent? Give your reasoning.

12. Consider a shipment of 8 generators. They produce the following voltages:

$$5.3, \quad 5.6, \quad 4.5, \quad 6.0, \quad 5.0, \quad 5.1, \quad 5.8, \quad 5.9.$$

Assume that these are independent samples from an $N(\mu, \sigma^2)$ distribution.

- (i) Find the sample mean, \bar{x} .
- (ii) Find the sample variance s^2 and the sample standard deviation s .
- (iii) Find a 95% confidence interval for the mean μ .
- (iv) Perform a t-test at the 5% level for the hypothesis

$$H_0 : \mu = 5 \quad \text{against} \quad H_1 : \mu \neq 5.$$

END OF PAPER

MATHEMATICS DEPARTMENT

3. TRIGONOMETRIC IDENTITIES AND HYPERBOLIC FUNCTIONS

MATHEMATICAL FORMULAE

1. VECTOR ALGEBRA

$$\mathbf{a} = a_1 \mathbf{i} + a_2 \mathbf{j} + a_3 \mathbf{k} = (a_1, a_2, a_3)$$

Scalar (dot) product:

$$\mathbf{a} \cdot \mathbf{b} = a_1 b_1 + a_2 b_2 + a_3 b_3$$

Vector (cross) product:

$$\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix}$$

Scalar triple product:

$$[\mathbf{a}, \mathbf{b}, \mathbf{c}] = \mathbf{a} \cdot \mathbf{b} \times \mathbf{c} = \mathbf{b} \cdot \mathbf{c} \times \mathbf{a} = \mathbf{c} \cdot \mathbf{a} \times \mathbf{b} = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix}$$

Vector triple product:

$$\mathbf{a} \times (\mathbf{b} \times \mathbf{c}) = (\mathbf{c} \cdot \mathbf{a})\mathbf{b} - (\mathbf{b} \cdot \mathbf{a})\mathbf{c}$$

2. SERIES

$$(1+x)^{\alpha} = 1 + \alpha x + \frac{\alpha(\alpha-1)}{2!} x^2 + \frac{\alpha(\alpha-1)(\alpha-2)}{3!} x^3 + \dots \quad (\alpha \text{ arbitrary, } |x| < 1)$$

$$e^x = 1 + x + \frac{x^2}{2!} + \dots + \frac{x^n}{n!} + \dots ,$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots + (-1)^n \frac{x^{2n}}{(2n)!} + \dots ,$$

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \dots ,$$

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots + (-1)^n \frac{x^{n+1}}{(n+1)} + \dots \quad (-1 < x \leq 1)$$

4. DIFFERENTIAL CALCULUS

$$\sin(a+b) = \sin a \cos b + \cos a \sin b ;$$

$$\cos(a+b) = \cos a \cos b - \sin a \sin b .$$

$$\cos iz = \cosh z ; \quad \cosh iz = \cos z ; \quad \sin iz = i \sinh z ; \quad \sinh iz = i \sin z .$$

1. VECTOR ALGEBRA

4. DIFFERENTIAL CALCULUS

(a) Leibniz's formula:

$$D^n(fg) = f D^n g + \binom{n}{1} Df D^{n-1} g + \dots + \binom{n}{r} D^r f D^{n-r} g + \dots + D^n f g .$$

(b) Taylor's expansion of $f(x)$ about $x = a$:

$$f(a+h) = f(a) + h f'(a) + h^2 f''(a)/2! + \dots + h^n f^{(n)}(a)/n! + \epsilon_n(h) ,$$

where $\epsilon_n(h) = h^{n+1} f^{(n+1)}(a+\theta h)/(n+1)!$, $0 < \theta < 1$.

(c) Taylor's expansion of $f(x, y)$ about (a, b) :

$$f(a+h, b+k) = f(a, b) + [hf_x + kf_y]_{a,b} + 1/2! [h^2 f_{xx} + 2hk f_{xy} + k^2 f_{yy}]_{a,b} + \dots$$

(d) Partial differentiation of $f(x, y)$:

i. If $y = y(x)$, then $f = F(x)$, and $\frac{df}{dx} = \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} \frac{dy}{dx}$.

ii. If $x = x(t)$, $y = y(t)$, then $f = F(t)$, and $\frac{df}{dt} = \frac{\partial f}{\partial x} \frac{dx}{dt} + \frac{\partial f}{\partial y} \frac{dy}{dt}$.

iii. If $x = x(u, v)$, $y = y(u, v)$, then $f = F(u, v)$, and

$$\frac{\partial F}{\partial u} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial u} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial u}, \quad \frac{\partial F}{\partial v} = \frac{\partial f}{\partial x} \frac{\partial x}{\partial v} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial v} .$$

(e) Stationary points of $f(x, y)$ occur where $f_x = 0$, $f_y = 0$ simultaneously.

Let (a, b) be a stationary point: examine $D = [f_{xx} f_{yy} - (f_{xy})^2]_{a,b}$.

If $D > 0$ and $f_{xx}(a, b) < 0$, then (a, b) is a maximum;

If $D > 0$ and $f_{xx}(a, b) > 0$, then (a, b) is a minimum;

If $D < 0$ then (a, b) is a saddle-point.

(f) Differential equations:

- i. The first order linear equation $dy/dx + P(x)y = Q(x)$ has an integrating factor $I(x) = \exp[\int P(x)(dx)]$, so that $\frac{d}{dx}(Iy) = IQ$.

- ii. $P(x, y)dx + Q(x, y)dy = 0$ is exact if $\partial Q/\partial x = \partial P/\partial y$.

5. INTEGRAL CALCULUS

- (a) An important substitution: $\tan(\theta/2) = t$:
 $\sin \theta = 2t/(1+t^2)$, $\cos \theta = (1-t^2)/(1+t^2)$, $d\theta = 2dt/(1+t^2)$.

- (b) Some indefinite integrals:

$$\int (a^2 - x^2)^{-1/2} dx = \sin^{-1}\left(\frac{x}{a}\right), \quad |x| < a.$$

$$\int (a^2 + x^2)^{-1/2} dx = \sinh^{-1}\left(\frac{x}{a}\right) = \ln\left\{\frac{x}{a} + \left(1 + \frac{x^2}{a^2}\right)^{1/2}\right\}.$$

$$\int (x^2 - a^2)^{-1/2} dx = \cosh^{-1}\left(\frac{x}{a}\right) = \ln\left|\frac{x}{a} + \left(\frac{x^2}{a^2} - 1\right)^{1/2}\right|.$$

$$\int (a^2 + x^2)^{-1} dx = \left(\frac{1}{a}\right) \tan^{-1}\left(\frac{x}{a}\right).$$

7. LAPLACE TRANSFORMS

Function	Transform	Function	Transform	Transform
$f(t)$	$F(s) = \int_0^\infty e^{-st} f(t) dt$	$a f(t) + b g(t)$	$a F(s) + b G(s)$	Transform
df/dt	$sF(s) - f(0)$	$d^2 f/dt^2$	$s^2 F(s) - sf(0) - f'(0)$	
$e^{at} f(t)$	$F(s-a)$	$t f(t)$	$-dF(s)/ds$	
$(\partial/\partial \alpha) f(t, \alpha)$	$(\partial/\partial \alpha) F(s, \alpha)$	$\int_0^t f(u) du$	$F(s) / s$	
$\int_0^t f(u) g(t-u) du$	$F(s) G(s)$	1	$t^n (n = 1, 2, \dots)$	$n! / s^{n+1}, (s > 0)$
e^{at}	$1/(s-a), (s > a)$		$\sin \omega t$	$\omega / (s^2 + \omega^2), (s > 0)$
$\cos \omega t$	$s / (s^2 + \omega^2), (s > 0)$	$H(t-T) = \begin{cases} 0, & t < T \\ 1, & t > T \end{cases}$	$e^{-sT}/s, (s, T > 0)$	

6. NUMERICAL METHODS

- (a) Approximate solution of an algebraic equation:

If a root of $f(x) = 0$ occurs near $x = a$, take $x_0 = a$ and
 $x_{n+1} = x_n - [f(x_n) / f'(x_n)]$, $n = 0, 1, 2 \dots$

(Newton Raphson method).
 (b) Formulae for numerical integration: Write $x_n = x_0 + nh$, $y_n = y(x_n)$.

- i. Trapezium rule (1-strip): $\int_{x_0}^{x_1} y(x) dx \approx (h/2) [y_0 + y_1]$.
 ii. Simpson's rule (2-strip): $\int_{x_0}^{x_2} y(x) dx \approx (h/3) [y_0 + 4y_1 + y_2]$.

- (c) Richardson's extrapolation method: Let $I = \int_a^b f(x) dx$ and let I_1 , I_2 be two estimates of I obtained by using Simpson's rule with intervals h and $h/2$. Then, provided h is small enough,

$$I_2 + (I_2 - I_1)/15,$$

is a better estimate of I .

8. FOURIER SERIES

- If $f(x)$ is periodic of period $2L$, then $f(x+2L) = f(x)$, and

$$f(x) = \frac{1}{2}a_0 + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{L} + \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{L}, \text{ where}$$

$$a_n = \frac{1}{L} \int_{-L}^L f(x) \cos \frac{n\pi x}{L} dx, \quad n = 0, 1, 2, \dots \text{ and}$$

$$b_n = \frac{1}{L} \int_{-L}^L f(x) \sin \frac{n\pi x}{L} dx, \quad n = 1, 2, 3, \dots$$

Parseval's theorem

$$\frac{1}{L} \int_{-L}^L [f(x)]^2 dx = \frac{a_0^2}{2} + \sum_{n=1}^{\infty} (a_n^2 + b_n^2).$$

1. Probabilities for events

For events A , B , and C

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

More generally $P(\bigcup A_i) =$

$$\sum P(A_i) - \sum P(A_i \cap A_j) + \sum P(A_i \cap A_j \cap A_k) - \dots$$

The odds in favour of A

$$P(A) / P(\bar{A})$$

Conditional probability

$$P(A | B) = \frac{P(A \cap B)}{P(B)} \quad \text{provided that } P(B) > 0$$

Chain rule

$$P(A \cap B \cap C) = P(A) P(B | A) P(C | A \cap B)$$

Bayes' rule

$$P(A | B) = \frac{P(A) P(B | A)}{P(A) P(B | A) + P(\bar{A}) P(B | \bar{A})}$$

A and B are independent if

$$P(B | A) = P(B)$$

A , B , and C are independent if

$$P(A \cap B \cap C) = P(A)P(B)P(C), \quad \text{and}$$

$$P(A \cap B) = P(A)P(B), \quad P(B \cap C) = P(B)P(C), \quad P(C \cap A) = P(C)P(A)$$

2. Probability distribution, expectation and variance

The probability distribution for a discrete random variable X is called the probability mass function (pmf) and is the complete set of probabilities $\{p_x\} = \{P(X = x)\}$

Expectation $E(X) = \mu = \sum_x x p_x$

For function $g(x)$ of x , $E\{g(X)\} = \sum_x g(x)p_x$, so $E(X^2) = \sum_x x^2 p_x$

Sample mean $\bar{x} = \frac{1}{n} \sum_k x_k$ estimates μ from random sample x_1, x_2, \dots, x_n

Variance $\text{var}(X) = \sigma^2 = E\{(X - \mu)^2\} = E(X^2) - \mu^2$

Sample variance $s^2 = \frac{1}{n-1} \left\{ \sum_k x_k^2 - \frac{1}{n} \left(\sum_j x_j \right)^2 \right\}$ estimates σ^2

Standard deviation $\text{sd}(X) = \sigma$

If value y is observed with frequency n_y

$$n = \sum_y n_y, \quad \sum_k x_k = \sum_y y n_y, \quad \sum_k x_k^2 = \sum_y y^2 n_y$$

Skewness $\beta_1 = E\left(\frac{X - \mu}{\sigma}\right)^3$ is estimated by $\frac{1}{n-1} \sum \left(\frac{x_i - \bar{x}}{s}\right)^3$

Kurtosis $\beta_2 = E\left(\frac{X - \mu}{\sigma}\right)^4 - 3$ is estimated by $\frac{1}{n-1} \sum \left(\frac{x_i - \bar{x}}{s}\right)^4 - 3$

Sample median \tilde{x} or x_{med} . Half the sample values are smaller and half larger

If the sample values x_1, \dots, x_n are ordered as $x_{(1)} \leq x_{(2)} \leq \dots \leq x_{(n)}$,

then $\tilde{x} = x_{(\frac{n+1}{2})}$ if n is odd, and $\tilde{x} = \frac{1}{2}(x_{(\frac{n}{2})} + x_{(\frac{n+2}{2})})$ if n is even

α -quantile $Q(\alpha)$ is such that $P(X \leq Q(\alpha)) = \alpha$

Sample α -quantile $\widehat{Q}(\alpha)$ Proportion α of the data values are smaller

Lower quartile $Q_1 = \widehat{Q}(0.25)$ one quarter are smaller

Upper quartile $Q_3 = \widehat{Q}(0.75)$ three quarters are smaller

Sample median $\tilde{x} = \widehat{Q}(0.5)$ estimates the population median $Q(0.5)$

3. Probability distribution for a continuous random variable

The cumulative distribution function (cdf) $F(x) = P(X \leq x) = \int_{x_0=-\infty}^x f(x_0)dx_0$

The probability density function (pdf) $f(x) = \frac{dF(x)}{dx}$

$E(X) = \mu = \int_{-\infty}^{\infty} x f(x)dx$, $\text{var}(X) = \sigma^2 = E(X^2) - \mu^2$, where $E(X^2) = \int_{-\infty}^{\infty} x^2 f(x)dx$

4. Discrete probability distributions

Discrete Uniform $Uniform(n)$

$$p_x = \frac{1}{n} \quad (x = 1, 2, \dots, n) \quad \mu = (n+1)/2, \quad \sigma^2 = (n^2 - 1)/12$$

Binomial distribution $Binomial(n, \theta)$

$$p_x = \binom{n}{x} \theta^x (1-\theta)^{n-x} \quad (x = 0, 1, 2, \dots, n) \quad \mu = n\theta, \quad \sigma^2 = n\theta(1-\theta)$$

Poisson distribution $Poisson(\lambda)$

$$p_x = \frac{\lambda^x e^{-\lambda}}{x!} \quad (x = 0, 1, 2, \dots) \quad (\text{with } \lambda > 0) \quad \mu = \lambda, \quad \sigma^2 = \lambda$$

Geometric distribution $Geometric(\theta)$

$$p_x = (1-\theta)^{x-1}\theta \quad (x = 1, 2, 3, \dots) \quad \mu = \frac{1}{\theta}, \quad \sigma^2 = \frac{1-\theta}{\theta^2}$$

5. Continuous probability distributions

Uniform distribution $Uniform(\alpha, \beta)$

$$f(x) = \begin{cases} \frac{1}{\beta - \alpha} & (\alpha < x < \beta), \\ 0 & (\text{otherwise}). \end{cases} \quad \mu = (\alpha + \beta)/2, \quad \sigma^2 = (\beta - \alpha)^2/12$$

Exponential distribution $Exponential(\lambda)$

$$f(x) = \begin{cases} \lambda e^{-\lambda x} & (0 < x < \infty), \\ 0 & (-\infty < x \leq 0). \end{cases} \quad \mu = 1/\lambda, \quad \sigma^2 = 1/\lambda^2$$

Normal distribution $N(\mu, \sigma^2)$

$$f(x) = \frac{1}{\sqrt{2\pi\sigma^2}} \exp\left\{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2\right\} \quad (-\infty < x < \infty), \quad E(X) = \mu, \quad \text{var}(X) = \sigma^2$$

Standard normal distribution $N(0,1)$

$$\text{If } X \text{ is } N(\mu, \sigma^2), \text{ then } Y = \frac{X-\mu}{\sigma} \text{ is } N(0,1)$$

6. Reliability

For a device in continuous operation with failure time random variable T having pdf $f(t)$ ($t > 0$)

$$\text{The reliability function at time } t \quad R(t) = P(T > t)$$

$$\text{The failure rate or hazard function} \quad h(t) = f(t)/R(t)$$

$$\text{The cumulative hazard function} \quad H(t) = \int_0^t h(t_0) dt_0 = -\ln\{R(t)\}$$

$$\text{The Weibull}(\alpha, \beta) \text{ distribution has} \quad H(t) = \beta t^\alpha$$

7. System reliability

For a system of k devices, which operate independently, let

$$R_i = P(D_i) = P(\text{"device } i \text{ operates"})$$

The system reliability, R , is the probability of a path of operating devices

A system of devices in series operates only if every device operates

$$R = P(D_1 \cap D_2 \cap \dots \cap D_k) = R_1 R_2 \dots R_k$$

A system of devices in parallel operates if any device operates

$$R = P(D_1 \cup D_2 \cup \dots \cup D_k) = 1 - (1 - R_1)(1 - R_2) \dots (1 - R_k)$$

8. Covariance and correlation

The covariance of X and Y $\text{cov}(X, Y) = E(XY) - \{E(X)\}\{E(Y)\}$

$$\text{From pairs of observations } (x_1, y_1), \dots, (x_n, y_n) \quad S_{xy} = \sum_k x_k y_k - \frac{1}{n} (\sum_i x_i) (\sum_j y_j)$$

$$S_{xx} = \sum_k x_k^2 - \frac{1}{n} (\sum_i x_i)^2, \quad S_{yy} = \sum_k y_k^2 - \frac{1}{n} (\sum_j y_j)^2$$

$$\text{Sample covariance} \quad s_{xy} = \frac{1}{n-1} S_{xy} \quad \text{estimates } \text{cov}(X, Y)$$

$$\text{Correlation coefficient} \quad \rho = \text{corr}(X, Y) = \frac{\text{cov}(X, Y)}{\text{sd}(X) \cdot \text{sd}(Y)}$$

$$\text{Sample correlation coefficient} \quad r = \frac{S_{xy}}{\sqrt{S_{xx} S_{yy}}} \quad \text{estimates } \rho$$

9. Sums of random variables

$$E(X + Y) = E(X) + E(Y)$$

$$\text{var}(X + Y) = \text{var}(X) + \text{var}(Y) + 2\text{cov}(X, Y)$$

$$\text{cov}(aX + bY, cX + dY) = (ac)\text{var}(X) + (bd)\text{var}(Y) + (ad + bc)\text{cov}(X, Y)$$

If X is $N(\mu_1, \sigma_1^2)$, Y is $N(\mu_2, \sigma_2^2)$, and $\text{cov}(X, Y) = c$, then $X + Y$ is $N(\mu_1 + \mu_2, \sigma_1^2 + \sigma_2^2 + 2c)$

10. Bias, standard error, mean square error

If t estimates θ (with random variable T giving t)

$$\underline{\text{Bias of } t} \quad \text{bias}(t) = E(T) - \theta$$

$$\underline{\text{Standard error of } t} \quad \text{se}(t) = \text{sd}(T)$$

$$\underline{\text{Mean square error of } t} \quad \text{MSE}(t) = E\{(T - \theta)^2\} = \{\text{se}(t)\}^2 + \{\text{bias}(t)\}^2$$

If \bar{x} estimates μ , then $\text{bias}(\bar{x}) = 0$, $\text{se}(\bar{x}) = \sigma/\sqrt{n}$, $\text{MSE}(\bar{x}) = \sigma^2/n$, $\widehat{\text{se}}(\bar{x}) = s/\sqrt{n}$

Central limit property If n is fairly large, \bar{x} is from $N(\mu, \sigma^2/n)$ approximately

11. Likelihood

The likelihood is the joint probability as a function of the unknown parameter θ .

For a random sample x_1, x_2, \dots, x_n

$$\ell(\theta; x_1, x_2, \dots, x_n) = P(X_1 = x_1 | \theta) \cdots P(X_n = x_n | \theta) \quad (\text{discrete distribution})$$

$$\ell(\theta; x_1, x_2, \dots, x_n) = f(x_1 | \theta) f(x_2 | \theta) \cdots f(x_n | \theta) \quad (\text{continuous distribution})$$

The maximum likelihood estimator (MLE) is $\hat{\theta}$ for which the likelihood is a maximum

12. Confidence intervals

If x_1, x_2, \dots, x_n are a random sample from $N(\mu, \sigma^2)$ and σ^2 is known, then

the 95% confidence interval for μ is $(\bar{x} - 1.96 \frac{\sigma}{\sqrt{n}}, \bar{x} + 1.96 \frac{\sigma}{\sqrt{n}})$

If σ^2 is estimated, then from the Student t table for t_{n-1} we find $t_0 = t_{n-1, 0.05}$

The 95% confidence interval for μ is $(\bar{x} - t_0 \frac{s}{\sqrt{n}}, \bar{x} + t_0 \frac{s}{\sqrt{n}})$

13. Standard normal table Values of pdf $\phi(y) = f(y)$ and cdf $\Phi(y) = F(y)$

y	$\phi(y)$	$\Phi(y)$	y	$\phi(y)$	$\Phi(y)$	y	$\phi(y)$	$\Phi(y)$	y	$\Phi(y)$

16. The chi-squared goodness-of-fit test

The frequencies n_y are grouped so that the fitted frequency \hat{n}_y for every group exceeds about 5.

$$X^2 = \sum_y \frac{(n_y - \hat{n}_y)^2}{\hat{n}_y} \text{ is referred to the table of } \chi_k^2 \text{ with significance point } p,$$

where k is the number of terms summed, less one for each constraint, eg matching total frequency, and matching \bar{x} with μ

17. Joint probability distributions

Discrete distribution $\{p_{xy}\}$, where $p_{xy} = P(\{X = x\} \cap \{Y = y\})$.

Let $p_{x\bullet} = P(X = x)$, and $p_{\bullet y} = P(Y = y)$, then

$$p_{x\bullet} = \sum_y p_{xy} \quad \text{and} \quad P(X = x \mid Y = y) = \frac{p_{xy}}{p_{\bullet y}}$$

Continuous distribution

$$\text{Joint cdf} \quad F(x, y) = P(\{X \leq x\} \cap \{Y \leq y\}) = \int_{x_0=-\infty}^x \int_{y_0=-\infty}^y f(x_0, y_0) dx_0 dy_0$$

$$\text{Joint pdf} \quad f(x, y) = \frac{\partial^2 F(x, y)}{\partial x \partial y}$$

$$\text{Marginal pdf of } X \quad f_X(x) = \int_{-\infty}^{\infty} f(x, y_0) dy_0$$

$$\text{Conditional pdf of } X \text{ given } Y = y \quad f_{X|Y}(x|y) = \frac{f(x, y)}{f_Y(y)} \quad (\text{provided } f_Y(y) > 0)$$

18. Linear regression

To fit the linear regression model $y = \alpha + \beta x$ by $\hat{y}_x = \hat{\alpha} + \hat{\beta}x$ from observations

$$(x_1, y_1), \dots, (x_n, y_n), \text{ the least squares fit is} \quad \hat{\alpha} = \bar{y} - \bar{x}\hat{\beta}, \quad \hat{\beta} = \frac{S_{xy}}{S_{xx}}$$

$$\text{The residual sum of squares} \quad \text{RSS} = S_{yy} - \frac{S_{xy}^2}{S_{xx}}$$

$$\hat{\sigma}^2 = \frac{\text{RSS}}{n-2} \quad \frac{n-2}{\sigma^2} \hat{\sigma}^2 \text{ is from } \chi_{n-2}^2$$

$$E(\hat{\alpha}) = \alpha, \quad E(\hat{\beta}) = \beta,$$

$$\text{var}(\hat{\alpha}) = \frac{\sum x_i^2}{n S_{xx}} \sigma^2, \quad \text{var}(\hat{\beta}) = \frac{\sigma^2}{S_{xx}}, \quad \text{cov}(\hat{\alpha}, \hat{\beta}) = -\frac{\bar{x}}{S_{xx}} \sigma^2$$

$$\hat{y}_x = \hat{\alpha} + \hat{\beta}x, \quad E(\hat{y}_x) = \alpha + \beta x, \quad \text{var}(\hat{y}_x) = \left\{ \frac{1}{n} + \frac{(x - \bar{x})^2}{S_{xx}} \right\} \sigma^2$$

$$\frac{\hat{\alpha} - \alpha}{\text{se}(\hat{\alpha})}, \quad \frac{\hat{\beta} - \beta}{\text{se}(\hat{\beta})}, \quad \frac{\hat{y}_x - \alpha - \beta x}{\text{se}(\hat{y}_x)} \text{ are each from } t_{n-2}$$

2/1
SOLUTION

(i) Poles at $z^2 + 1 = 0$

$$\text{i.e. } z = \pm i$$

②

(ii) Residues at $z = i$ in

$$R_1 = \lim_{z \rightarrow i} \frac{(z-i) e^{iz}}{z^2 + 1} = \frac{e^{-1}}{2i}$$

②

Residue at $z = -i$ in

$$R_2 = \lim_{z \rightarrow -i} \frac{(z+i) e^{iz}}{z^2 + 1} = -\frac{e^{-1}}{2i}$$

②

(iii)

Contour C

$$\therefore \oint_C \frac{e^{iz}}{z^2+1} dz = 2\pi i \sum (\text{residues within } C)$$

Cauchy's theorem

$$= 2\pi i \frac{e^{-1}}{2i} = \frac{\pi}{e}$$

⑥

As $R \rightarrow \infty$ $e^{iz} \rightarrow 0$ provided z is in upper half-plane.

Similarly $\frac{1}{z^2+1} \rightarrow 0$

RW

2/2
SOLUTION

EEII (3) ②

Hence by Jordan's lemma

The integral over semicircle $\rightarrow 0$ as $R \rightarrow \infty$ ③

$$\therefore \int_{-\infty}^{\infty} \frac{e^{ix}}{x^2+1} dx = \frac{\pi}{e}$$

$$\text{Hence, } \int_{-\infty}^{\infty} \frac{\cos x + i \sin x}{x^2+1} dx = \frac{\pi}{e} \quad ②$$

$\frac{\sin x}{x^2+1}$ is odd and integral is zero
over symmetric range hence integral is zero
 $\cos x$ is even and integral is over
symmetric range hence we can

write

$$2 \int_0^{\infty} \frac{\cos x}{x^2+1} dx = \frac{\pi}{e}$$

③

28-3

SOLUTION

$$I = \int_0^{2\pi} \frac{d\theta}{3 + e^{i\theta}} \quad \cos\theta = \frac{1}{2}(e^{i\theta} + e^{-i\theta}) = \frac{1}{2} \frac{(z^2 + 1)}{z}$$

$$C: z = e^{i\theta} \quad dz = ie^{i\theta} d\theta = iz d\theta$$

$$\therefore I = \frac{1}{i} \oint_C \frac{1}{z} \cdot \frac{dz}{3 + \frac{z^2 + 1}{2z}}$$

$$= \frac{2}{i} \oint_C \frac{dz}{z^2 + 6z + 1}$$

$$z^2 + 6z + 1 = 0 \text{ has roots at } z_{1,2} = -3 \pm 2\sqrt{2}$$

Both are -ve: one lies in C & one outside C.

$$z_1 = -3 + 2\sqrt{2} \quad z_2 = -3 - 2\sqrt{2}$$

Thus only z_1 counts.

$$\begin{aligned} \text{The residue of } \frac{1}{z^2 + 6z + 1} \text{ at } z_1 \text{ is } & \frac{1}{z_1 - z_2} \\ & = \frac{1}{4\sqrt{2}} \end{aligned}$$

$$\therefore I = \frac{2}{i} \cdot 2\pi i \times \frac{1}{4\sqrt{2}} = \frac{\pi}{\sqrt{2}}$$

$$\begin{aligned}
 \frac{1}{2\pi} \int_{-\infty}^{\infty} |\bar{f}(\omega)|^2 d\omega &= \frac{1}{2\pi} \int_{-\infty}^{\infty} \left(\int_{-\infty}^{\infty} e^{-i\omega t} f(t) dt \right) \left(\int_{-\infty}^{\infty} e^{+i\omega \tau} f^*(\tau) d\tau \right) d\omega \\
 &= \int_{-\infty}^{\infty} f(t) \left\{ \underbrace{\int_{-\infty}^{\infty} \left(\frac{1}{2\pi} \int_{-\infty}^{\infty} e^{i\omega(\tau-t)} d\omega \right) f^*(\tau) d\tau}_{\delta(\tau-t)} \right\} dt \\
 &= \int_{-\infty}^{\infty} f(t) \left(\int_{-\infty}^{\infty} \delta(\tau-t) f^*(\tau) d\tau \right) dt = \int_{-\infty}^{\infty} |f(t)|^2 dt
 \end{aligned}$$

8

$$\begin{aligned}
 i) \quad \bar{\Delta}(\omega) &= \int_{-\infty}^{\infty} e^{-i\omega t} \Delta(t) dt = \int_{-1}^0 (1+t) e^{-i\omega t} dt + \int_0^1 (1-t) e^{-i\omega t} dt \\
 &= -\frac{1}{i\omega} \left\{ \int_{-1}^0 (1+t) d(e^{-i\omega t}) + \int_0^1 (1-t) d(e^{-i\omega t}) \right\} \\
 &= \frac{i}{\omega} \left\{ [e^{-i\omega t}(1+t)]_{-1}^0 - \int_{-1}^0 e^{-i\omega t} dt + [e^{-i\omega t}(1-t)]_0^1 + \int_0^1 e^{-i\omega t} dt \right\} \\
 &= \frac{1}{\omega} (2 - e^{i\omega} - e^{-i\omega}) = \frac{2 - 2 \cos \omega}{\omega^2} = \frac{4 \sin^2 \frac{\omega}{2}}{\omega^2} = \text{sinc}^2 \omega
 \end{aligned}$$

6

$$\begin{aligned}
 ii) \quad \int_{-\infty}^{\infty} \text{sinc}^4 \omega d\omega &= \int_{-\infty}^{\infty} |\bar{\Delta}(\omega)|^2 d\omega \quad \text{by (i)} \\
 &= 2\pi \int_{-\infty}^{\infty} |\Delta(t)|^2 dt \quad \text{Parseval} \\
 &= 2\pi \left\{ \int_{-1}^0 (1+t)^2 dt + \int_0^1 (1-t)^2 dt \right\} \\
 &= 2\pi \left\{ [t + t^2 + \frac{1}{3}t^3]_{-1}^0 + [t - t^2 + \frac{1}{3}t^3]_0^1 \right\} \\
 &= 4\pi / 3.
 \end{aligned}$$

6

C8-5

SOLUTION

i) $\mathcal{L}(f * g) = \int_0^\infty e^{-st} \left(\int_0^t f(u)g(t-u)du \right) dt$

 $= \int_0^\infty f(u) \left(\int_{t=u}^{t=\infty} e^{-st} g(t-u)dt \right) du$

For the inner integral define $\theta = t-u$

$$\begin{aligned} \mathcal{L}(f * g) &= \int_0^\infty f(u) \left(\int_{\theta=0}^{\theta=\infty} e^{-s(\theta+u)} g(\theta) d\theta \right) du \\ &= \int_0^\infty f(u) e^{-su} du \int_0^\infty g(\theta) e^{-s\theta} d\theta = \bar{f}(s)\bar{g}(s) \end{aligned}$$

ii) Write $\frac{s}{(s^2+1)^2} = \frac{s}{s^2+1} \cdot \frac{1}{s^2+1} \equiv \bar{f}(s)\bar{g}(s)$

 $\bar{f}(s) = \frac{s}{s^2+1} \Rightarrow f(t) = \cos t$
 $\bar{g}(s) = \frac{1}{s^2+1} \Rightarrow g(t) = \sin t$

By the convolution theorem

$$\begin{aligned} \mathcal{L}^{-1}(\bar{f}(s)\bar{g}(s)) &= f * g = \int_0^t \cos u \sin(t-u) du \\ &= \sin t \int_0^t \cos^2 u du - \cos t \int_0^t \cos u \sin u du \\ &= \frac{1}{2} \sin t \int_0^t (1 + \cos 2u) du - \cos t \int_0^t \sin u d(\sin u) \\ &= \frac{1}{2} \sin t \left[u + \frac{1}{2} \sin 2u \right]_0^t - \frac{1}{2} \cos t (\sin^2 u)_0^t \\ &= \frac{1}{2} \sin t [t + \sin t \cos t] - \frac{1}{2} \cos t \sin^2 t \\ &= \frac{1}{2} t \sin t \end{aligned}$$

$$\ddot{x} + 4\dot{x} + 5x = f(t); \quad x_0 = 0 \quad \dot{x}_0 = 0$$

$$\mathcal{L}(x) = s\bar{x}(s) - x_0$$

$$\mathcal{L}(\dot{x}) = s^2\bar{x}(s) - s x_0 - \dot{x}_0$$

Tables.

$$(i) \quad \therefore (s^2\bar{x}(s) - s x_0 - \dot{x}_0) + 4(s\bar{x}(s) - x_0) + 5\bar{x}(s) = \bar{f}(s)$$

2

$$\therefore \bar{x}(s) = \frac{\bar{f}(s)}{s^2 + 4s + 5}$$

$$= \frac{\bar{f}(s)}{(s+2)^2 + 1} \quad \text{completing the square}$$

4

$$\bar{x}(s) = \bar{f}(s) \bar{g}(s)$$

$$\text{where } \bar{g}(s) = \frac{1}{(s+2)^2 + 1}$$

4

$$\text{Firstly } \bar{f}(s) \rightarrow f = f(t)$$

$$\bar{g}(s) = \frac{1}{(s+2)^2 + 1} \rightarrow g(t) = e^{-2t} \sin t$$

3

Shift Thm

$$\text{Convolution} \rightarrow x(t) = \int_0^t e^{-2u} \sin u f(t-u) du.$$

2

(ii) When the ICs are changed to $x_0 = 1, \dot{x}_0 = -2$

we have

$$\bar{x}(s) = \frac{\bar{f}(s)}{(s+2)^2 + 1} + \frac{s+2}{(s+2)^2 + 1}$$

5

$$\text{by shift rule } \mathcal{L}^{-1}\left\{\frac{s+2}{(s+2)^2 + 1}\right\} = e^{-2t} \cos t$$

which is the additional term

Unit tangent
vector

$$\hat{t} = \frac{d\vec{r}}{ds} = \hat{i} \frac{dx}{ds} + \hat{j} \frac{dy}{ds}$$

Unit normal
vector

$$\hat{n} \cdot \hat{t} = 0$$

$$\text{Thus write } \hat{n} = \pm \left(\hat{i} \frac{dy}{ds} - \hat{j} \frac{dx}{ds} \right)$$

$$\text{Choose } \underline{u} = \hat{i} Q - \hat{j} P$$

$$\operatorname{div} \underline{u} = Q_x - P_y ; \quad \underline{u} \cdot \underline{n} = Q \frac{dy}{ds} + P \frac{dx}{ds}$$

$$\therefore \text{G.T.} \rightarrow \oint_C (\underline{u} \cdot \underline{n}) ds = \iint_R \operatorname{div} \underline{u} dxdy$$

i)

2

ii)

$$\oint_C \underline{u} \cdot \underline{n} ds = \iint_R \operatorname{div} \underline{u} dxdy$$

$$\operatorname{div} \underline{u} = 2xg'(y)$$

$$\therefore \oint_C \underline{u} \cdot \underline{n} ds = 2 \iint_R x g'(y) dxdy$$

$$= 2 \int_0^1 x \left(\int_0^{x^2} g'(y) dy \right) dx$$

$$= 2 \int_0^1 x g(x^2) dx \quad g(0) = 0$$

$$= \int_0^1 g(\theta) d\theta \quad \theta = x^2$$

	EXAMINATION SOLUTIONS 2006-07	Course EE2(3)
Question 12		Marks & seen/unseen
Parts		
(i)	$\bar{x} = \frac{1}{8}(5.3 + 5.6 + 4.5 + 6.0 + 5.0 + 5.1 + 5.8 + 5.9) = 5.4$	2
(ii)	Let x_1, \dots, x_8 denote the observed values. $s^2 = \frac{1}{8-1} \left(\sum_{k=1}^8 x_k^2 - \frac{1}{8} \left(\sum_{j=1}^8 x_j \right)^2 \right) = \frac{1}{7} \left(235.16 - \frac{1}{8}(43.2)^2 \right)$ $= \frac{1}{7}(235.16 - 233.28) = \frac{1.88}{7} \approx 0.269$	Seen Similarly
(iii)	so $s = \sqrt{\frac{1.88}{7}} \approx 0.518$. From the Student t table we find $t_0 = t_{8-1, 0.05} = 2.36$. The 95% confidence interval for μ is thus $(\bar{x} - t_0 \frac{s}{\sqrt{8}}, \bar{x} + t_0 \frac{s}{\sqrt{8}}) = (5.4 - 2.36 \sqrt{\frac{1.88}{56}}, 5.4 + 2.36 \sqrt{\frac{1.88}{56}})$ $\approx (4.97, 5.83)$	3 1 2
(iv)	The test statistic is $t = \frac{\bar{x} - 5}{s/\sqrt{8}} = 0.4 \sqrt{\frac{56}{1.88}} \approx 2.18.$ The corresponding quantile t_0 from the Student t distribution is $t_{7, 0.05} = 2.36.$ Since $ t < 2.36$ the hypothesis H_0 is not rejected.	4 8
